Large Bearings

Engineering Section Table of Contents

1. Load rating and life

1.1 Bearing life

Even in bearings operating under normal conditions, the surfaces of the raceway and rolling elements are constantly being subjected to repeated compressive stresses which cause **spalling** (flaking) of these surfaces to occur. This spalling is due to material fatigue and will eventually cause bearings to fail.

The effective life of a bearing is usually defined **in terms of the total number of revolutions** a bearing can undergo before **spalling** of either the raceway surface or the rolling element surfaces occurs.

Other causes of bearing failure are often attributed to problems such as seizing, abrasions, cracking, chipping, gnawing, rust, etc. However, these so-called "causes" of bearing failure are usually themselves caused by improper installation, insufficient or improper lubrication, faulty sealing or inaccurate bearing selection.

Since the above-mentioned "causes" of bearing failure can be avoided by taking the proper precautions, and are not simply caused by material fatigue, they are considered separately from the flaking aspect.

1.2 Basic rated life and basic dynamic load rating

A group of seemingly identical bearings when subjected to identical load and operating conditions will exhibit a wide diversity in their durability. This "life" disparity can be accounted for by the difference in the fatigue of the bearing material itself.

This disparity is considered statistically when calculating bearing life, and **the basic rating life** is defined as follows.

The basic rating life is **based on a 90 % statistical model which is expressed as the total number of revolutions 90 % of the bearings in an identical group of bearings subjected to identical operating conditions will attain or surpass before spalling due to material fatigue. For bearings operating at fixed constant speeds, the basic rating life (90 % reliability) is expressed in the total number of hours of operation.** Basic dynamic load rating expresses a rolling bearing's capacity to support a dynamic load.

The basic dynamic load rating is **the load which a bearing can theoretically endure for a basic rating life of one million revolutions**. This is expressed as pure radial load for radial bearings and pure axial load for thrust bearings. These are referred to as "**basic dynamic radial load rating (C_r)**" and "**basic dynamic axial load rating (C_a)**".

The basic dynamic load ratings given in the bearing tables of this catalog are for bearings constructed of **NTN** high quality bearing materials and of good manufacturing quality.

The relationship between the basic rating life, the basic dynamic load rating and the dynamic equivalent load is shown in formula (1.1) and formula (1.2).

For ball bearings : $L_{10} = \left(\frac{C}{P}\right)^3 \cdots\cdots\cdots (1.1)$

For roller bearings: $L_{10} = \left(\frac{C}{P}\right)^{10/3} \cdots\cdots (1.2)$

Where:

L_{10} : Basic rating life 10^6 revolutions

C : Basic dynamic load rating, N

Radial bearing: C_r

Thrust bearing: C_a

P : Dynamic equivalent load, N[1)]

Radial bearing: P_r

Thrust bearing: P_a

n : Rotational speed, min^{-1}

Note: 1) For more details, please refer to the section "2. Bearing load calculation".

The relationship between rotational speed n and speed factor f_n as well as the relationship between life factor f_h and basic rating life L_{10h} are shown in **Table 1.1** and **Fig. 1.1**.

Table 1.1 Bearing basic rating life, life factor, and speed factor

Division	Ball bearing	Roller bearing
Basic rating life L_{10h}, h	$\frac{10^6}{60n}\left(\frac{C}{P}\right)^3 = 500 f_h^{\,3}$	$\frac{10^6}{60n}\left(\frac{C}{P}\right)^{10/3} = 500 f_h^{\,10/3}$
Life factor f_h	$f_n \frac{C}{P}$	$f_n \frac{C}{P}$
Speed factor f_n	$\left(\frac{33.3}{n}\right)^{1/3}$	$\left(\frac{33.3}{n}\right)^{3/10}$

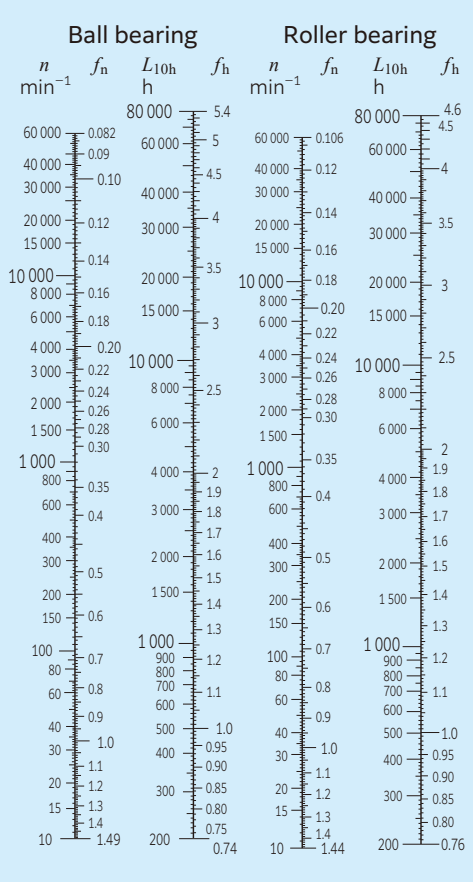

Fig. 1.1 Bearing life rating scale

When several bearings are incorporated in machines or equipment as complete units, all the bearings in the unit are considered as a whole when computing bearing system life (see formula 1.3).

$$L = \frac{1}{\left(\frac{1}{L_1{}^e} + \frac{1}{L_2{}^e} + \cdots \frac{1}{L_n{}^e}\right)^{1/e}} \quad \cdots\cdots (1.3)$$

Where:

L : Total basic rating life of entire unit, h

$L_1, L_2 \cdots L_n$: Basic rating life of individual bearings 1, 2, ⋯ n, h

$e = 10/9$ ····· For ball bearings

$e = 9/8$ ····· For roller bearings

When the load conditions vary at regular intervals, the life can be given by formula (1.4).

$$L_m = \left(\frac{\phi_1}{L_1} + \frac{\phi_2}{L_2} + \cdots\cdots \frac{\phi_j}{L_j}\right)^{-1} \cdots\cdots (1.4)$$

Where:

L_m : Total life of bearing, h

ϕ_j : Frequency of individual load conditions ($\Sigma\phi_j = 1$)

L_j : Life under individual conditions, h

If dynamic equivalent load P and rotational speed n are operating conditions of the bearing, basic rated dynamic load C that satisfies required life of the bearing is determined using **Table 1.1** and formula (1.5). Bearings that satisfy the required C can be selected from the bearing dimensions table provided in the catalog.

$$C = P\frac{f_h}{f_n} \quad \cdots\cdots (1.5)$$

1.3 Adjusted rating life

The basic bearing rating life can be calculated through the formulas mentioned earlier in Section 1.2. However, in some applications bearing reliability higher than 90 % may be required. In addition, bearing life may be enhanced by the use of specialty bearing materials or manufacturing processes. Bearing life is also sometimes affected by operating conditions such as lubrication, temperature and rotational speed.

Basic rating life adjusted to compensate for reliability, special bearing materials and enhancements, and specific operation conditions is called "**adjusted rating life**", and is determined using formula (1.6).

$$L_{na} = a_1 \cdot a_2 \cdot a_3 \cdot L_{10} \quad \cdots\cdots (1.6)$$

Where:

L_{na} : Adjusted rating life 10^6 revolutions

a_1 : Life adjustment factor for reliability

a_2 : Life adjustment factor for special bearing properties

a_3 : Life adjustment factor for operating conditions

1.3.1 Life adjustment factor for reliability a_1

The value of life adjustment factor for reliability a_1 is provided in **Table 1.2** for reliability of 90 % or greater.

1.3.2 Life adjustment factor for special bearing properties a_2

Bearing characteristics concerning life vary according to bearing material, quality of material and if using a special manufacturing process. In this case, life is adjusted using **life adjustment factor for special bearing properties a_2**.

The basic dynamic load ratings listed in the catalog are based on **NTN**'s standard material and the adjustment factor used is $a_2 = 1$. However, an adjustment factor of a_2 other than 1 may be used for bearings with specially enhanced materials and manufacturing methods. [NOTE: $a_2 < 1$ may occur for temperature stabilization] $a_2 > 1$ may be used for bearings with specially improved materials and manufacturing methods.

Bearings made of high carbon chrome bearing steel, conventionally heat treated, may experience dimensional changes during operation if used at high temperatures for extended periods of time. Temperature stabilization treatment (**TS treatment**) can be used to provide increased dimensional stability of bearing materials at high operational temperatures. However, the dimensional stabilization treatment results in a lower overall hardness of heat treated bearing materials; therefore, the life is adjusted by multiplying by life adjustment factor for special bearing properties a_2 given in **Table 1.3**.

For further clarification please consult with **NTN** Engineering.

Table 1.2 Life adjustment factor for reliability a_1

Reliability %	L_n	Life adjustment factor for reliability a_1
90	L_{10}	1
95	L_5	0.64
96	L_4	0.55
97	L_3	0.47
98	L_2	0.37
99	L_1	0.25
99.2	$L_{0.8}$	0.22
99.4	$L_{0.6}$	0.19
99.6	$L_{0.4}$	0.16
99.8	$L_{0.2}$	0.12
99.9	$L_{0.1}$	0.093
99.92	$L_{0.08}$	0.087
99.94	$L_{0.06}$	0.080
99.95	$L_{0.05}$	0.077

Table 1.3 Treatment for dimensional stabilization

Code	Max. operating temperature °C	Life adjustment factor for special bearing properties a_2
TS2	160	1.00
TS3	200	0.73
TS4	250	0.48

Please consult with **NTN** Engineering for life adjustment factor for special bearing properties (a_2) when using dimensional stabilization treatment combined with any specialty bearing material.

1.3.3 Life adjustment factor for operating conditions a_3

Life adjustment factor for operating conditions a_3 is used to compensate for when lubrication condition worsens due to a rise in temperature or rotational speed, the lubricant deteriorates or it becomes contaminated with foreign matter.

Generally speaking, when lubricating conditions are satisfactory, the a_3 factor has a value of 1.0; and when lubricating conditions are exceptionally favorable, and all other operating conditions are normal, a_3 can have a value greater than 1.0. The factor a_3 may be less than 1.0 due to the following cases:

- Dynamic viscosity of lubrication is too low for bearing operating temperature (13 mm²/s or less for ball bearings, 20 mm²/s or less for roller bearings as a standard)
- Rotational speed is particularly low (when the product of pitch diameter D_{pw} mm and rotational speed n min⁻¹ is $D_{pw} \cdot n < 10\,000$)
- Lubricant contaminated with foreign matter or moisture

For bearings used under special operating conditions, please consult with **NTN** Engineering.

Even if $a_2 > 1$ is used for specialty bearings made of enhanced materials or produced by special manufacturing methods, $a_2 \times a_3 < 1$ is used if lubricating conditions are not favorable.

When an excessively heavy load is applied, harmful plastic distortion may result at the contact surfaces between the rolling elements and raceways. The formulas for determining basic rating life (1.1, 1.2, and 1.6) do not apply if P_r exceeds either C_{0r} or $0.5C_r$ for radial bearings, or if P_a exceeds $0.5C_a$ for thrust bearings.

1.4 Modified rating life

1.4.1 Background

Adjusted rating life L_{na} of bearings is as shown in formula (1.6). System conditions corresponding to a_2 and a_3 are considered independently in that approach. However, it is desirable to consider the integrated system as a whole, resulting in adoption of ISO 281:2007. This approach considers **life modification factor a_{ISO}**, which provides a more practical method to consider the influence of lubrication, contamination and fatigue load on bearing life. Based on these decisions in ISO 281, JIS B 1518 was similarly revised in 2013.

Modified rating life L_{nm} using life modification factor a_{ISO} can be obtained by formula (1.7).

$$L_{nm} = a_1 \cdot a_{ISO} \cdot L_{10} \quad \cdots\cdots (1.7)$$

1.4.2 Life modification factor a_{ISO}

The life modification factor, a_{ISO}, is a function of lubrication, contamination, material characteristics, and load as shown in formula (1.8).

$$a_{ISO} = f\left(\frac{e_C C_u}{P},\ \kappa\right) \quad \cdots\cdots (1.8)$$

Where:

C_u : Fatigue load limit

The fatigue load limit is a load applied on bearings that results in the fatigue limit stress at the maximum loaded contact within the raceway. This depends on the bearing type, internal specifications, quality, and material strength. In ISO 281:2007, 1.5 GPa is recommended as contact stress corresponding to C_u for the bearings made of commonly used high quality material and good manufacturing quality. The fatigue load limit values with respect to the **NTN** bearing numbers are specified in each specification table.

e_C : Contamination factor

The presence of hard particle contaminants in the lubricant (oil) has the potential to form indentations on the raceway surface, resulting in surface initiated damage and in reduction in bearing life. Contamination factor e_C considers this and depends on the level of contamination, bearing size, and lubricant viscosity (oil film thickness). As shown in **Table 1.4**, approximate values are determined by the bearing size [may be substituted by rolling element pitch diameter D_{pw}, average bearing diameter $(d + D)/2$], filtration and seal structures (including presence of pre-washing).

κ : Viscosity ratio

Bearings are used on the assumption that the rolling contact surface is separated by the lubricant. However, when the viscosity of the lubricant is low, separation becomes insufficient and metal to metal contact occurs, causing surface initiated damage. Viscosity ratio κ considers this effect and is represented by formula (1.9) by the ratio of dynamic viscosity ν in use with respect to reference dynamic viscosity ν_1 of the lubricant.

$$\kappa = \nu/\nu_1 \quad \cdots\cdots (1.9)$$

Reference dynamic viscosity ν_1 depends on rotational speed n and size (D_{pw}), and can be obtained by **Fig. 1.2** or formula (1.10) and formula (1.11).

Table 1.4 Value of contamination factor e_C

Level of contamination	e_C	
	D_{pw} < 100 mm	D_{pw} ≥ 100 mm
Extreme cleanliness Particle size of the order of lubricant film thickness; laboratory conditions	1	1
High cleanliness Oil filtered through extremely fine filter; conditions typical of bearing greased for life and sealed	0.8-0.6	0.9-0.8
Normal cleanliness Oil filtered through fine filter; conditions typical of bearings greased for life and shielded	0.6-0.5	0.8-0.6
Slight contamination Slight contamination in lubricant	0.5-0.3	0.6-0.4
Typical contamination Conditions typical of bearings without integral seals; course filtering; wear particles and ingress from surroundings	0.3-0.1	0.4-0.2
Severe contamination Bearing environment heavily contaminated and bearing arrangement with inadequate sealing	0.1-0	0.1-0
Very severe contamination	0	0

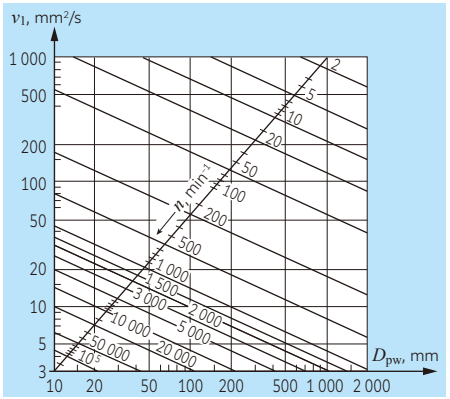

Fig. 1.2 Diagram for reference dynamic viscosity ν_1

In the case of $n < 1\,000$ min^{-1},

$$\nu_1 = 45\,000 n^{-0.83} D_{pw}^{-0.5} \quad \cdots\cdots (1.10)$$

In the case of $n \geq 1\,000$ min^{-1},

$$\nu_1 = 4\,500 n^{-0.5} D_{pw}^{-0.5} \quad \cdots\cdots (1.11)$$

Fig. 1.3 shows the relationship among C_u/P, e_C, κ and, a_{ISO} of radial ball bearings. Using the figure has the following restrictions:

1) For practical use, the life modification factor shall be limited $a_{ISO} \leq 50$.
2) In the case of $\kappa > 4$, $\kappa = 4$. The same approach does not apply in the case of $\kappa < 0.1$.

Diagrams for radial roller bearings, thrust ball bearings, and thrust roller bearings have also been presented (see **Fig. 1.4** through **Fig.1.6**). The diagrams can be applied regardless of lubrication types; however, for grease lubrication, special additives, and special rotating behaviors, consult with **NTN** Engineering.

1.4.3 Applicable bearings of modified rating life

Fatigue load limit C_u used for the calculation of life modification factor a_{ISO} depends on the bearing materials. **NTN** bearings that have undergone standard heat treatment through hardening (immersion quenching) and is made of bearing steel, the fatigue load limit value with respect to each bearing number is specified in each dimension table, and a_{ISO} can be applied.

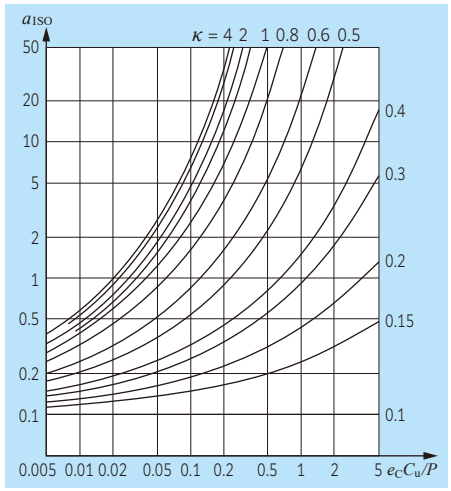

Fig. 1.3 Life modification factor a_{ISO} (radial ball bearing)

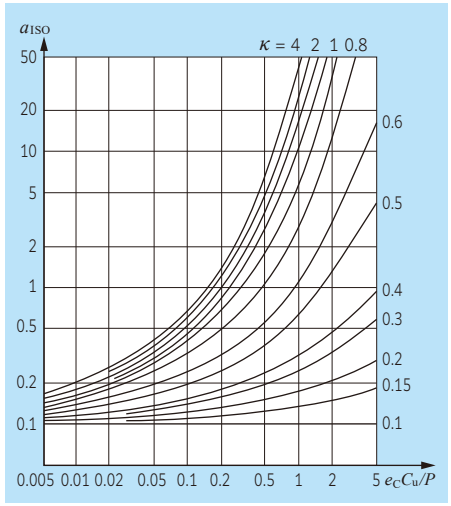

Fig. 1.4 Life modification factor a_{ISO} (radial roller bearing)

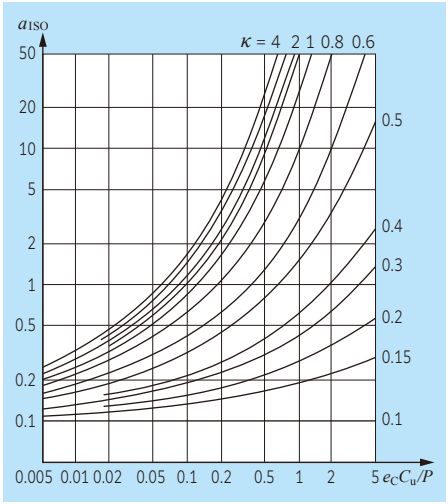

Fig. 1.5 Life modification factor a_{ISO} (thrust ball bearing)

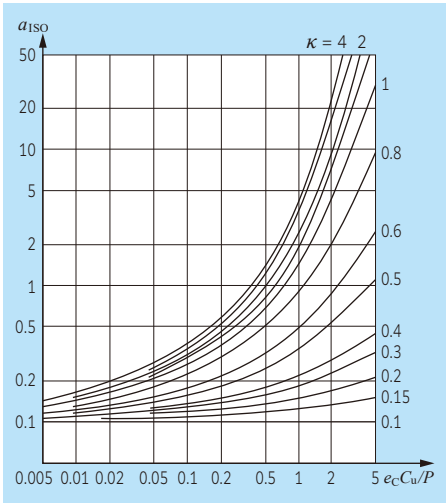

Fig. 1.6 Life modification factor a_{ISO} (thrust roller bearing)

1.5 Basic static load rating

It has been found through experience that a permanent deformation of 0.0001 times the diameter of the rolling element, occurring at the most heavily stressed contact point between the raceway and the rolling elements, can be tolerated without any subsequent impairment of bearing operation.

Roller bearings: 4 000 MPa
Ball bearings
(excluding self-aligning ball bearings): 4 200 MPa
Self-aligning ball bearings: 4 600 MPa

Testing indicates the above level of permanent deformation corresponds to a calculated contact stress as shown below. The basic static load rating is defined as the static applied load which results in such a contact stress at the center of the contact patch between the raceway and the rolling element receiving the maximum load.

Referred to as "**basic static radial load rating**" for radial bearings and "**basic static axial load rating**" for thrust bearings, the basic static load rating is expressed as C_{0r} or C_{0a} respectively and is provided in the bearing dimensions table.

1.6 Allowable static equivalent load

Generally, the static equivalent load which can be permitted (refer to page A-14) is limited by the basic static load rating as stated in Section 1.5. However, depending on application requirements regarding friction and smooth operation, these limits may be greater or lesser than the basic static load rating.

This is generally determined by taking the safety factor S_0 expressed by formula (1.12) and guidelines of **Table 1.5** into account.

$$S_0 = C_0 / P_0 \quad \cdots\cdots (1.12)$$

Where:
S_0 : Safety factor
C_0 : Basic static load rating, N
Radial bearing: C_{0r}
Thrust bearing: C_{0a}
P_0 : Static equivalent load, N
Radial bearing: P_{0r}
Thrust bearing: P_{0a}

Table 1.5 Minimum safety factor values S_0

Operating conditions	Ball bearing	Roller bearing
Applications that require quiet rotation	2	3
Applications subjected to impact loads	1.5	3
Normal rotation applications	1	1.5

Note: 1. For thrust spherical roller bearings, min. S_0 value = 4.
2. When vibration and/or shock loads are present, a load factor based on the shock load needs to be included in the P_0 max value.
3. If a large axial load is applied to deep groove ball bearings or angular ball bearings, the contact ellipse may exceed the raceway surface. For more information, please contact **NTN** Engineering.
4. When an As type raceway washer is used in a thrust bearing, min. S_0 value = 3.

1.7 Review of basic dynamic load ratings

As a result of continuous improvement related to material cleanliness, and production techniques, years of in-house durability testing has confirmed **NTN** bearings produced today have a longer operating life compared with past products. Based on this bearing life test data, the basic dynamic load ratings of ball and roller bearings were reviewed and updated to more accurately reflect true bearing performance.

The basic dynamic load ratings for many **NTN** products have been formally increased and can be found in the dimensional tables for each bearing type within this catalog.

*Some bearings use the same basic dynamic load rating as conventional products.

1.8 Bearing life calculation tool

The basic rating life of bearings can be calculated using the bearing technical calculation tool on the **NTN** website (https:// www.ntnglobal.com).

2. Bearing load calculation

To compute bearing loads, the forces which act on the shaft being supported by the bearing must be determined. Loads which act on the shaft and its related parts include weight of the rotating components, load produced when the machine performs work, and load produced by transmission of dynamic force. These can be mathematically calculated, but calculation is difficult in many cases.

A method of calculating loads that act upon shafts that convey dynamic force, which is the primary application of bearings, is provided herein.

2.1 Load acting on shafts

2.1.1 Load factor

There are many instances where the actual operational shaft load is much greater than the theoretically calculated load, due to shock. This actual shaft load can be estimated by using formula (2.1).

$$K = f_w \cdot K_c \quad \cdots\cdots (2.1)$$

Where:

K : Actual shaft load, N
f_w : Load factor (see **Table 2.1**)
K_c : Theoretically calculated value, N

Table 2.1 Load factor f_w

Amount of shock	f_w	Machine application examples
Very little or no shock	1.0-1.2	Electric machines, machine tools, measuring instruments.
Light shock	1.2-1.5	Railway vehicles, automobiles, rolling mills, metal working machines, paper making machines, printing machines, aircraft, textile machines, electrical units, office machines.
Heavy shock	1.5-3.0	Crushers, agricultural equipment, construction equipment, cranes.

2.2 Mean load

The load on bearings used in machines under normal circumstances will, in many cases, fluctuate according to a fixed time period or planned operation schedule. The load on bearings operating under such conditions can be converted to a mean load (F_m). This is a load which gives bearings the same life they would have under constant operating conditions.

(1) Fluctuating stepped load (see Fig. 2.1)

The mean bearing load, F_m, for stepped loads is calculated from formula (2.2). F_1, F_2 ····· F_n are the loads acting on the bearing; n_1, n_2 ····· n_n and t_1, t_2 ····· t_n are the bearing speeds and operating times, respectively.

$$F_m = \left[\frac{\Sigma (F_i{}^p n_i t_i)}{\Sigma (n_i t_i)} \right]^{1/p} \quad \cdots\cdots (2.2)$$

Where:

$p = 3$ For ball bearings
$p = 10/3$ For roller bearings

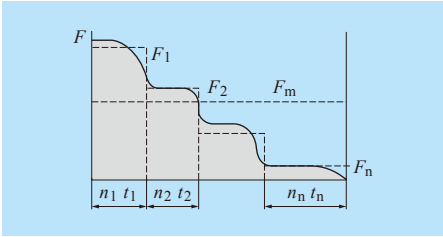

Fig. 2.1 Stepped load

(2) Continuously fluctuating load (see Fig. 2.2)

Where it is possible to express the function $F(t)$ in terms of load cycle t_o and time t, the mean load is found by using formula (2.3).

$$F_m = \left[\frac{1}{t_o} \int_o^{t_o} F(t)^p \, d_t \right]^{1/p} \quad \cdots\cdots (2.3)$$

Where:

$p = 3$ For ball bearings
$p = 10/3$ For roller bearings

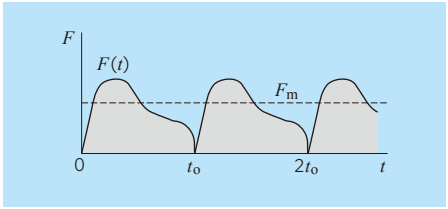

Fig. 2.2 Load that fluctuated as function of time

(3) Linear fluctuating load (see Fig. 2.3)

The mean load, F_m, can be approximated by formula (2.4).

$$F_m = \frac{F_{min} + 2F_{max}}{3} \quad \cdots\cdots (2.4)$$

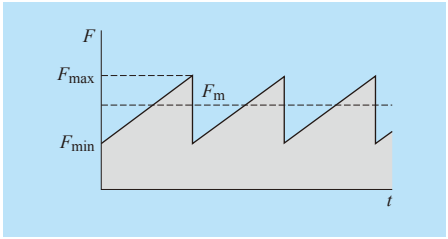

Fig. 2.3 Linear fluctuating load

(4) Sinusoidal fluctuating load (see Fig. 2.4)

The mean load, F_m, can be approximated by formula (2.5) and formula (2.6).

Case (a) $F_m = 0.75F_{max}$ ····· (2.5)
Case (b) $F_m = 0.65F_{max}$ ····· (2.6)

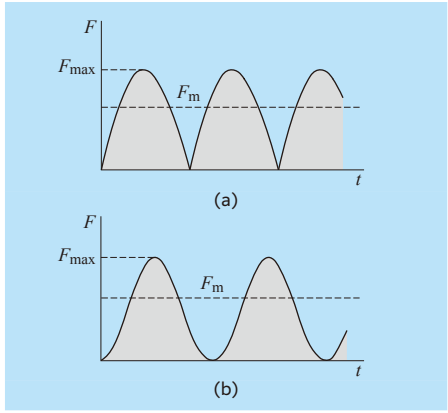

Fig. 2.4 Sinusoidal variable load

2.3 Equivalent load

2.3.1 Dynamic equivalent load

When both dynamic radial loads and dynamic axial loads act on a bearing at the same time, **the hypothetical load acting on the center of the bearing which gives the bearings the same life** as if they had only a radial load or only an axial load **is called the dynamic equivalent load**.

For radial bearings, this load is expressed as pure radial load and is called the dynamic equivalent radial load. For thrust bearings, it is expressed as pure axial load, and is called the dynamic equivalent axial load.

(1) Dynamic equivalent radial load

The dynamic equivalent radial load is expressed by formula (2.7).

$$P_r = XF_r + YF_a \quad \cdots\cdots (2.7)$$

Where:

P_r : Dynamic equivalent radial load, N
F_r : Actual radial load, N
F_a : Actual axial load, N
X : Radial load factor
Y : Axial load factor

The values for X and Y are listed in the bearing tables.

(2) Dynamic equivalent axial load

As a rule, standard thrust bearings with α contact angle of 90° cannot carry radial loads. However, thrust spherical roller bearings can accept some radial load. The dynamic equivalent axial load for these bearings is expressed by formula (2.8).

$$P_a = F_a + 1.2F_r \quad \cdots\cdots (2.8)$$

Where:

P_a : Dynamic equivalent axial load, N
F_a : Actual axial load, N
F_r : Actual radial load, N

Provided that $F_r / F_a \leq 0.55$ only.

2.3.2 Static equivalent load

The static equivalent load is **a hypothetical load which would cause the same total permanent deformation at the most heavily stressed contact point between the rolling elements and the raceway** as under actual load conditions; that is when both static radial loads and static axial loads are simultaneously applied to the bearing.

For radial bearings this hypothetical load refers to pure radial loads, and for thrust bearings it refers to pure centric axial loads. These loads are designated static equivalent radial loads and static equivalent axial loads respectively.

(1) Static equivalent radial load

For radial bearings the static equivalent radial load can be found by using formula (2.9) or formula (2.10). The greater of the two resultant values is always taken for P_{0r}.

$$P_{0r} = X_0 F_r + Y_0 F_a \quad \cdots\cdots (2.9)$$

$$P_{0r} = F_r \quad \cdots\cdots (2.10)$$

Where:

P_{0r} : Static equivalent radial load, N
F_r : Actual radial load, N
F_a : Actual axial load, N
X_0 : Static radial load factor
Y_0 : Static axial load factor

The values for X_0 and Y_0 are listed in the bearing tables.

(2) Static equivalent axial load

For thrust spherical roller bearings the static equivalent axial load is expressed by formula (2.11).

$$P_{0a} = F_a + 2.7F_r \quad \cdots\cdots (2.11)$$

Where:

P_{0a} : Static equivalent axial load, N
F_a : Actual axial load, N
F_r : Actual radial load, N

Provided that $F_r / F_a \leq 0.55$ only.

2.3.3 Load calculation for angular contact ball bearings and tapered roller bearings

For angular contact ball bearings and tapered roller bearings the pressure cone apex (load center) is located as shown in **Fig. 2.5**, and their values are listed in the bearing tables.

When radial loads act on these types of bearings a component force is induced in the axial direction. For this reason, these bearings are used in pairs. For load calculation this component force must be taken into consideration and is expressed by formula (2.12).

$$F_a = \frac{0.5F_r}{Y} \quad \cdots\cdots (2.12)$$

Where:

F_a : Axial component force, N
F_r : Actual radial load, N
Y : Axial load factor

The axial loads for these bearing pairs are given in **Table 2.2**.

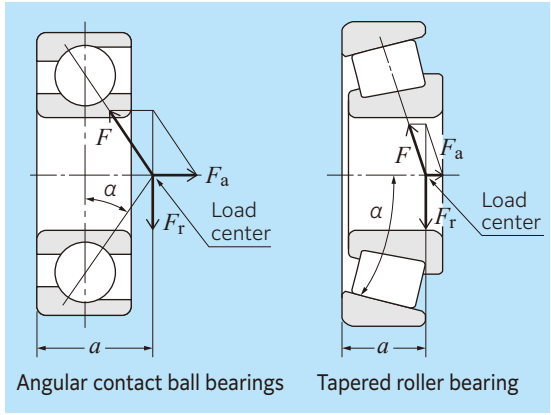

Fig. 2.5 Pressure cone apex and axial component force

Table 2.2 Bearing arrangement and equivalent load

Load center	Load conditions	Axial load
Rear 	$\frac{0.5F_{rI}}{Y_I} \leq \frac{0.5F_{rII}}{Y_{II}} + F_a$	$F_{aI} = \frac{0.5F_{rII}}{Y_{II}} + F_a$ ———
Front 	$\frac{0.5F_{rI}}{Y_I} > \frac{0.5F_{rII}}{Y_{II}} + F_a$	——— $F_{aII} = \frac{0.5F_{rI}}{Y_I} - F_a$
Rear 	$\frac{0.5F_{rII}}{Y_{II}} \leq \frac{0.5F_{rI}}{Y_I} + F_a$	——— $F_{aII} = \frac{0.5F_{rI}}{Y_I} + F_a$
Front 	$\frac{0.5F_{rII}}{Y_{II}} > \frac{0.5F_{rI}}{Y_I} + F_a$	$F_{aI} = \frac{0.5F_{rII}}{Y_{II}} - F_a$ ———

Note: 1. Applies when preload is zero.
2. Radial forces in the opposite direction to the arrow in the above illustration are also regarded as positive.
3. Dynamic equivalent radial load is calculated by using the table on the right of the size table of the bearing after axial load is obtained for X and Y factor.

3. Bearing tolerances

3.1 Dimensional and rotational accuracy

Bearing "tolerances" or dimensional accuracy and running accuracy, are regulated by ISO and JIS standards, JIS B 1514 (rolling bearing tolerances) series. For **dimensional accuracy**, these standards prescribe the tolerances necessary when installing bearings on shafts or in housings. **Running accuracy** is defined as the allowable limits for bearing runout during operation.

Dimensional accuracy

Dimensional accuracy constitutes the acceptable values for bore diameter, outside diameter, assembled bearing width, and bore diameter uniformity as seen in chamfer dimensions, allowable inner ring tapered bore deviation and shape error. Also included are variation of mean bore diameter within a plane, outside diameter within a plane, mean outside diameter within a plane, as well as raceway thickness (for thrust bearings).

Running accuracy

Running accuracy constitutes the acceptable values for inner and outer ring radial runout and axial runout, inner ring side surface squareness, and outer ring outside diameter squareness.

Allowable rolling bearing tolerances have been established according to precision classes. Bearing precision is stipulated as JIS Class 6, Class 5, Class 4, or Class 2, with precision rising from ordinary precision indicated by JIS Class 0.

Table 3.1 indicates which standards and precision classes are applicable to the major bearing types. **Table 3.2** shows a relative comparison between JIS B 1514 precision class standards and other standards.

For details of allowable limitations and values, refer to **Table 3.3** through **Table 3.10**, which are described in the application table column of **Table 3.1**. Allowable values for chamfer dimensions are shown in **Table 3.11**. Allowable limitations and values for radial bearing inner ring tapered bores are shown in **Table 3.12**.

Table 3.1 Bearing types and applicable tolerance

Bearing type		Applicable standard	Accuracy class					Tolerance table
Deep groove ball bearings		JIS B 1514-1 (ISO 492)	Class 0	Class 6	Class 5	Class 4	Class 2	Table 3.3
Angular contact ball bearings			Class 0	Class 6	Class 5	Class 4	Class 2	
Self-aligning ball bearings			Class 0	—	—	—	—	
Cylindrical roller bearings			Class 0	Class 6	Class 5	Class 4	Class 2	
Spherical roller bearings			Class 0	—	—	—	—	
Tapered roller bearings	Metric series (single-row)	JIS B 1514-1	Class 0, 6X	Class 6[1)]	Class 5	Class 4	—	Table 3.4
	Metric series (double-row/four-row)	—	Class 0[1)]	—	—	—	—	Table 3.6
	Inch series	ANSI/ABMA Std.19	Class 4	Class 2	Class 3	Class 0	Class 00	Table 3.5
Thrust ball bearings		JIS B 1514-2 (ISO 199)	Class 0	Class 6	Class 5	Class 4	—	Table 3.7
Thrust cylindrical roller bearings			Class 0	Class 6	Class 5	Class 4	—	
Thrust spherical roller bearings			Class 0	—	—	—	—	Table 3.8
Thrust tapered roller bearings	Metric series	**NTN** standard	Class 0	—	—	—	—	Table 3.9
	Inch series	ANSI/ABMA Std.23	Class 2	—	—	—	—	Table 3.10

1) The class is the **NTN** standard class.

Table 3.2 Comparison of tolerance classifications of national standards

Standard	Applicable standard	Accuracy class					Bearing type
Japanese industrial standards (JIS)	JIS B 1514-1	Class 0, 6	Class 6	Class 5	Class 4	Class 2	Radial bearings
	JIS B 1514-2	Class 0	Class 6	Class 5	Class 4	—	Thrust bearings
International Organization for Standardization (ISO)	ISO 492	Normal class Class 6X	Class 6	Class 5	Class 4	Class 2	Radial bearings
	ISO 199	Normal class	Class 6	Class 5	Class 4	—	Thrust bearings
	ISO 578	Class 4	—	Class 3	Class 0	Class 00	Tapered roller bearings (Inch series)
Deutsches Institut fur Normung (DIN)	DIN 620	P0	P6	P5	P4	P2	All types
American National Standards Institute (ANSI)	ANSI/ABMA Std.20[1)]	ABEC-1 RBEC-1	ABEC-3 RBEC-3	ABEC-5 RBEC-5	ABEC-7	ABEC-9	Radial bearings (excluding tapered roller bearings)
American Bearing Manufacturers Association (ABMA)	ANSI/ABMA Std.19	Class 4	Class 2	Class 3	Class 0	Class 00	Tapered roller bearings (Inch series)

1) "ABEC" is applied to ball bearings and "RBEC" to roller bearings.
Note: 1. JIS B 1514 series, ISO 492, 199, and DIN 620 have the same specification level.
2. The tolerance and allowance of JIS B 1514 series are slightly different from those of ABMA standards.

Table 3.12 (2) Tolerance of tapered bores of radial bearings and tapered bores with allowable standard taper ratio 1:30 (Class 0)

Unit: μm

d mm Over	Incl.	Δ_{dmp} Upper	Lower	$\Delta_{d1mp}-\Delta_{dmp}$ Upper	Lower	V_{dsp}[1) 2)] Max.
80	120	+20	0	+35	0	22
120	180	+25	0	+40	0	40
180	250	+30	0	+46	0	46
250	315	+35	0	+52	0	52
315	400	+40	0	+57	0	57
400	500	+45	0	+63	0	63
500	630	+50	0	+70	0	70

1) Applies to all radial flat planes of tapered bores.
2) Does not apply to diameter series 7 and 8.
Note: Quantifiers

For a standard taper ratio of $\frac{1}{12}$, $d_1 = d + \frac{1}{12}B$

For a standard taper ratio of $\frac{1}{30}$, $d_1 = d + \frac{1}{30}B$

Δ_{dmp} : Dimensional difference of the mean bore diameter within the flat surface at the theoretical small end of the tapered bore
Δ_{d1mp} : Dimensional difference of the mean bore diameter within the flat surface at the theoretical large end of the tapered bore
V_{dsp} : Unevenness of the bore diameter with the flat surface
B : Nominal width of inner ring
α : $\frac{1}{2}$ of the tapered bore's standard taper angle

For a standard taper ratio of $\frac{1}{12}$
α = 2°23′9.4″
= 2.38594°
= 0.041643 rad

For a standard taper ratio of $\frac{1}{30}$
α = 0°57′17.4″
= 0.95484°
= 0.016665 rad

4. Bearing fits

4.1 Resultant fits

For rolling bearings, it is necessary to fix inner and outer rings on the shaft or in the housing so that relative movement does not occur between fitting surfaces during operation or under load. This relative movement between the mating surfaces of the bearing and the shaft or housing can occur in a radial direction, an axial direction, or in the direction of rotation. Types of resultant fit include **tight**, **transition** and **loose fits**, which describe whether or not there is interference between the bearing and the shaft or housing. It is also necessary to select a reliable axial fixing method such as tightening nuts, bolts, retaining rings, etc. For more information on fixing of bearings, see section "8.1 Fixing of bearings".

The most effective way to fix the mating surfaces between a bearing and shaft or housing is to apply a "tight fit". The advantage of a tight fit for thin walled bearings is that it provides uniform load support over the entire ring circumference without any loss of load carrying capacity. However, with a tight fit, ease of installation and disassembly is lost; and when using a non-separable bearing as the floating-side bearing, axial displacement is not possible. For this reason, a tight fit cannot be recommended in all cases.

4.2 The necessity of a proper fit

In some cases, an improper fit may lead to damage and shorten bearing life. Therefore it is necessary to carefully select the proper fit. Some possible bearing failures caused by an improper fit are listed below.

- Raceway cracking, early spalling and displacement of raceway
- Raceway and shaft or housing abrasion caused by creeping and fretting corrosion
- Seizing caused by negative internal clearances
- Increased noise and deteriorated rotational accuracy due to raceway groove deformation

4.3 Fit selection

Selection of a proper fit is dependent upon thorough analysis of bearing operating conditions, including consideration of:

- Shaft and housing material, wall thickness, surface finish accuracy, etc.
- Machinery operating conditions (nature and magnitude of load, rotational speed, temperature, etc.)

4.3.1 "Tight fit" or "Loose fit"

(1) For raceways under rotating loads, a **tight fit** is necessary (refer to **Table 4.1**). "Raceways under rotating loads" refers to raceways receiving loads rotating relative to their radial direction.
For raceways under static loads, on the other hand, a **loose fit** is sufficient.

(2) For non-separable bearings, such as deep groove ball bearings, it is generally recommended that either the inner ring or outer ring be given a **loose fit**.

Table 4.1 Radial load and bearing fit

Design	Bearing rotation	Ring load	Fit
Static load	Inner ring: Rotating Outer ring: Stationary	Rotating inner ring load Static outer ring load	Inner ring: Tight fit Outer ring: Loose fit
Unbalanced load	Inner ring: Stationary Outer ring: Rotating		
Static load	Inner ring: Stationary Outer ring: Rotating	Static inner ring load Rotating outer ring load	Inner ring: Loose fit Outer ring: Tight fit
Unbalanced load	Inner ring: Rotating Outer ring: Stationary		

4.3.2 Recommended fits

Bearing fit is governed by the tolerances selected for bearing shaft diameters and housing bore diameters.

Widely used fits for Class 0 tolerance bearings and various shaft and housing bore diameter tolerances are shown in **Fig. 4.1**.

Generally used, standard fits for most types of bearings and operating conditions are shown in **Table 4.2** through **Table 4.5**.

Table 4.2: Fits for radial bearings
Table 4.3: Fits for thrust bearings
Table 4.4: Fits for electric motor bearings
Table 4.5: Inch series tapered roller bearings Fits of (ANSI/ABMA CLASS 4)
Table 4.6: Inch series tapered roller bearings Fits of (ANSI/ABMA CLASS 3, CLASS 0)

4.3.3 Interference minimum and maximum values

The following points should be considered when it is necessary to calculate the interference for an application:

- Lower limit values
  1) Reduced interference due to radial loads
  2) Reduced interference due to differences between bearing temperature and ambient temperature
  3) Reduced interference due to variation in mating surface
  4) Reduced interference due to deformation
- Upper limit values

The upper limit value should not exceed 1/ 1 000 of the shaft diameter.

Required interference calculations are shown in the next page.

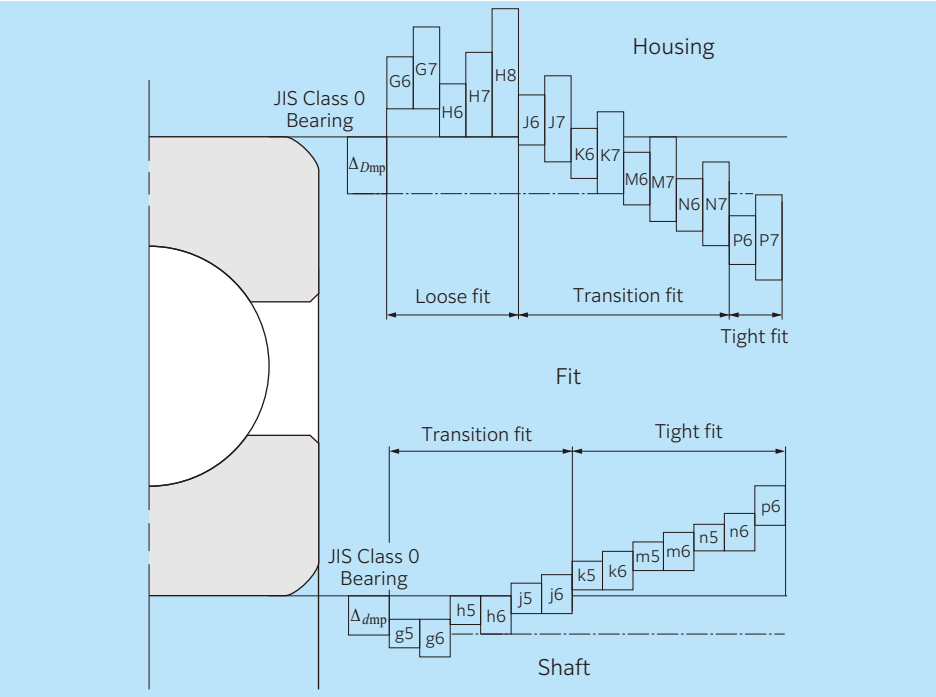

Fig 4.1 State of resultant fit

(1) Mating surface variation and interference

Interference decreases because the mating surface is smoothed by the resultant fit (surface roughness is reduced). The amount the interference decreases depends on the roughness of the mating surfaces. It is generally necessary to anticipate the following decrease in interference.

For ground surface finish: 1.0 to 2.5 μm
For turned surface finish: 5.0 to 7.0 μm

The interference including this decrease amount is called effective interference.

(2) Radial loads and required interference

Interference of the inner ring and shaft decreases when a radial load is applied to the bearing. The interference required for installation to solid shafts is expressed by formula (4.1) and formula (4.2) for each load condition.

General applications ($F_r \leq 0.3C_{0r}$)

$$\Delta d_F = 0.08(d \cdot F_r / B)^{1/2} \quad \cdots\cdots\cdots\cdots\cdots\cdots (4.1)$$

Under heavy load conditions ($F_r > 0.3C_{0r}$)

$$\Delta d_F = 0.02(F_r / B) \quad \cdots\cdots\cdots\cdots\cdots\cdots (4.2)$$

Where:

Δd_F : Required effective interference according to radial load, μm
d : Bearing bore diameter, mm
B : Inner ring width, mm
F_r : Actual radial load, N
C_{0r} : Basic static load rating, N

For hollow shafts, please contact **NTN** Engineering.

(3) Temperature difference and required interference

Interference between inner rings and steel shafts is reduced as a result of temperature increases (difference between bearing temperature and ambient temperature, ΔT) caused by bearing rotation. Calculation of the minimum required amount of interference in such cases is shown in formula (4.3).

$$\Delta d_T = 0.0015 \cdot d \cdot \Delta T \quad \cdots\cdots\cdots\cdots\cdots\cdots (4.3)$$

Where:

Δd_T : Required effective interference for temperature difference, μm
ΔT : Difference between bearing temperature and ambient temperature, °C
d : Bearing bore diameter, mm

(4) Maximum interference

When bearing rings are installed with an interference fit, tensile or compressive stress may occur along their raceways. If interference is too great, this may cause damage to the rings and reduce bearing life. The maximum stress due to the resultant fit must not exceed approximately 127 MPa for safety. If the value is to be exceeded, consult **NTN** Engineering.

(5) Interference change amount when materials other than steel are used for shafts and housings

When materials other than steel are used for shafts and housings, the fits between the inner ring and the shaft and the outer ring and the housing change because of the difference in the linear expansion coefficient of each material as the temperature rises during the rotation of the bearing. Therefore, it is necessary to set the resultant fit with linear expansion coefficients in consideration. Calculation of the change in interference is shown in formula (4.4).

$$\Delta d_{TE} = (\alpha_1 - \alpha_2) \times d \times \Delta T \quad \cdots\cdots\cdots\cdots (4.4)$$

Where:

Δd_{TE} : Change in interference caused by the difference in the linear expansion coefficients, mm
α_1 : Bearing linear expansion coefficient, 1/°C
α_2 : Shaft and housing linear expansion coefficient, 1/°C
d : Reference dimension of resultant fit, mm
ΔT : Temperature increase by bearing rotation, °C

4.3.4 Other details

(1) Large interference fits are recommended for,
- Operating conditions with large vibrations or shock loads
- Applications using hollow shafts or housings with thin walls
- Applications using housings made of light alloys or plastic

(2) Small interference fits are preferable for,
- Applications requiring high running accuracy
- Applications using small-sized bearings or thin-walled bearings

(3) A particular type of fit is recommended for SL-type cylindrical roller bearings (refer to page C-73).

(4) Bearing dimensions are measured and managed at a temperature of 20 °C.

Table 4.2 General standards for radial bearing fits (JIS Class 0, 6X, 6)

Table 4.2 (1) Tolerance class of shafts commonly used for radial bearings (Classes 0, 6X and 6)

Condition		Ball bearing		Cylindrical roller bearing Tapered roller bearing		Spherical roller bearing		Shaft tolerance class	Remarks
		Shaft diameter (mm)							
		Over	Incl.	Over	Incl.	Over	Incl.		
Cylindrical bore bearing (Classes 0, 6X and 6)									
Inner ring rotational load or load of undetermined direction	Light load [1] or Fluctuating load	18 100 —	100 200 —	— 40 140	40 140 200	— — —	— — —	js6 k6 m6	When greater accuracy is required js5, k5, and m5 may be substituted for js6, k6, and m6.
	Normal load [1]	18 100 140 200 — —	100 140 200 280 — —	— 40 100 140 200 —	40 100 140 200 400 —	— 40 65 100 140 280	40 65 100 140 280 500	k5 m5 m6 n6 p6 r6	Alteration of inner clearances to accommodate fit is not a consideration with single-row angular contact bearings and tapered roller bearings. Therefore, k5 and m5 may be substituted for k6 and m6.
	Heavy load [1] or Impact load	— — —	— — —	50 140 200	140 200 —	50 100 140	100 140 200	n6 p6 r6	Use bearings with larger internal clearances than CN clearance bearings.
Static inner ring load	Inner ring must move easily over shaft	Overall shaft diameter						g6	When greater accuracy is required use g5. For large bearings, f6 will suffice to facilitate movement.
	Inner ring does not have to move easily over shaft	Overall shaft diameter						h6	When greater accuracy is required use h5.
Center axial load		Overall shaft diameter						js6	Generally, shaft and inner rings are not fixed using resultant fits.
Tapered bore bearing (Class 0) (with adapter or withdrawal sleeve)									
Full load		Overall shaft diameter						h9/IT5 [2]	h10/IT7 [2] will suffice for power transmitting shafts.

Table 4.2 (2) Fit with shaft [fits for tapered bore bearings (Class 0) with adapter assembly/ withdrawal sleeve]

Full load	All bearing types	Tolerance class	h9 /IT5 [2]	General applications
			h10/IT7 [2]	Transmission shafts, etc.

1) Standards for light loads, normal loads, and heavy loads
- Light loads: dynamic equivalent radial load ≤ $0.05C_r$
- Normal loads: $0.05C_r$ < dynamic equivalent radial load ≤ $0.10C_r$
- Heavy loads: $0.10C_r$ < dynamic equivalent radial load

2) IT5 and IT7 show shaft roundness tolerances, cylindricity tolerances, and related values.

Note: 1. All values and fits listed in the above tables are for solid steel shafts.
2. For ULTAGE™ series spherical roller bearings, refer to **Table 2** (page B-181) in Section "Spherical Roller Bearings".

Table 4.2 (3) Tolerance class of housing bores commonly used for radial bearings (Classes 0, 6X and 6)

Conditions				Housing bore tolerance class	Remarks
Housing	Load type, etc.		Outer ring axial direction movement 3)		
Single housing or Split housing	Static outer ring load	All types of loads	Yes	H7	G7 can be used for large bearings or bearings with large temperature differential between the outer ring and housing.
		Light load 1) or normal load 1)	Yes	H8	——
		Shaft and inner ring become hot	Easily	G7	F7 can be used for large bearings or bearings with large temperature differential between the outer ring and housing.
Single housing		Requires precise rotation under light or normal loads	As a rule, it cannot move.	K6	Primarily applies to roller bearings.
			Yes	JS6	Primarily applies to ball bearings.
		Requires low noise operation	Yes	H6	——
	Indeterminate load	Light load or normal load	Yes	JS7	If high accuracy is required, JS6 and K6 are used in place of JS7 and K7.
		Normal load or heavy load 1)	As a rule, it cannot move.	K7	
		High impact load	No	M7	——
	Rotating outer ring load	Light load or fluctuating load	No	M7	——
		Normal load or heavy load	No	N7	Primarily applies to ball bearings.
		Heavy load or large impact load with thin wall housing 2)	No	P7	Primarily applies to roller bearings.

1) Standards for light loads, normal loads, and heavy loads
Light loads: dynamic equivalent radial load ≤ $0.05C_r$
Normal loads: $0.05C_r$ < dynamic equivalent radial load ≤ $0.10C_r$
Heavy loads: $0.10C_r$ < dynamic equivalent radial load
2) The axial direction needs to be secured because the outer ring may move in the shaft direction, causing problems, depending on the use (Example: planetary gear, etc.).
3) Indicates whether or not outer ring axial movement is possible with non-separable type bearings.
Note: 1. All values and fits listed in the above tables are for cast iron or steel housings.
2. If only a center axial load is applied to the bearing, select a tolerance class that provides clearance for the outer ring in the radial direction.

Table 4.3 Standard fits for thrust bearings (JIS Class 0 and 6)
Table 4.3 (1) Shaft fits

Bearing type	Load conditions		Fit	Shaft diameter mm Over Incl.	Tolerance class
All thrust bearings	Centered axial load only		Transition fit	Overall shaft diameter	js6 or h6
Thrust spherical roller bearings	Combined load	Static inner ring load	Transition fit	Overall shaft diameter	js6
		Rotating inner ring load or Indeterminate load	Transition fit Tight fit	- 200 200 - 400 400 -	k6 or js6 m6 or k6 n6 or m6

Table 4.3 (2) Housing fits

Bearing type	Load conditions		Fit	Tolerance class	Remarks
All thrust bearings	Centered axial load only		Loose fit	Select a tolerance class that will provide clearance between outer ring and housing.	
				H8	Greater accuracy required with thrust ball bearings
Thrust spherical roller bearings	Combined load	Static outer ring load		H7	——
		Indeterminate load or Rotating outer ring load	Transition fit	K7	Normal operating conditions
				M7	For relatively large radial loads

Note: All values and fits listed in the above tables are for cast iron or steel housings.

1) Fit symbol "L" indicates clearance and "T" indicates interference.
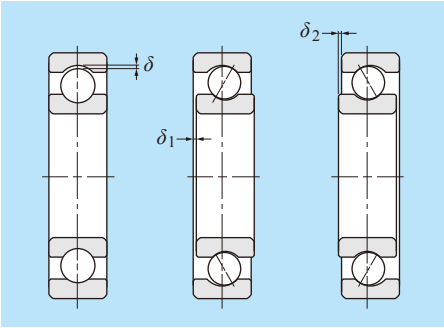
Note: For Class 0, nominal bearing outside diameter D applies to 304.8 mm or less.

5. Bearing internal clearance

5.1 Bearing internal clearance

Bearing internal clearance is the amount of internal free movement before mounting. As shown in **Fig. 5.1**, when either the inner ring or the outer ring is fixed and the other ring is free to move, displacement can take place in either an axial or radial direction. This amount of displacement (radially or axially) is termed the internal clearance and, depending on the direction, is called **the radial internal clearance** or **the axial internal clearance**.

The internal clearance values for each bearing class are shown in **Table 5.2** through **Table 5.9**.



Radial internal clearance = δ Axial internal clearance = $\delta_1 + \delta_2$

Fig. 5.1 Internal clearance

5.2 Selection of internal clearance

The **internal clearance** of a bearing **under operating conditions** (effective clearance) is **usually smaller** than the initial clearance before being installed and operated. This is due to several factors including bearing fit, the difference in temperature between the inner and outer rings, etc. As a bearing's operating clearance has an effect on bearing life, heat generation, vibration, noise, etc.; care must be taken in selecting the most suitable operating clearance.

5.2.1 Criteria for selecting bearing internal clearance

A bearing's life is theoretically at its maximum when operating clearance is slightly negative in steady operation. However, in reality it is difficult to constantly maintain this optimal condition. If the negative clearance becomes larger by fluctuating operating conditions, heat will be produced and the life will decrease severely. Under normal circumstances, a **study should be performed to select an operating clearance slightly larger than zero**.

For ordinary operating conditions, use fitting for ordinary loads. If rotational speed and operating temperature are ordinary, selecting normal clearance enables you to obtain the proper operating clearance.

Table 5.1 gives examples applying internal clearances other than CN (normal) clearance.

Table 5.1 Examples of applications where bearing clearances other than CN (normal) clearance are used

Operating conditions	Applications	Selected clearance
With a heavy or shock load, high fit.	Railway vehicle axles	C3
	Vibrating screens	C3, C4
With an indeterminate load, both inner and outer rings are tight fit.	Railway vehicle traction motors	C4
	Tractors and final reduction gear	C4
Shaft or inner ring is heated.	Paper making machines and driers	C3, C4
	Table rollers for rolling mill	C3
Adjustment of clearance to minimize shaft runout.	Main spindles of lathes (Double-row cylindrical roller bearings)	C9NA, C0NA

5.2.2 Calculation of operating clearance

Operating clearance of a bearing can be calculated from initial bearing internal clearance and considering the decrease in clearance due to fitting and the difference in temperature of the inner and outer rings using formula (5.1).

$$\Delta_e = \Delta_0 - (\delta_f + \delta_t) = \Delta_f - \delta_t \quad \cdots\cdots\cdots\cdots (5.1)$$

Where:

Δ_e : Effective internal clearance, mm
Δ_0 : Bearing internal clearance (initial), mm
Δ_f : Residual clearance (clearance after preloading), mm
δ_f : Reduced amount of clearance due to fitting, mm
δ_t : Reduced amount of clearance due to temperature differential of inner and outer rings, mm

(1) Reduced internal clearance due to fitting

When bearings are installed with interference fits on shafts and in housings, the inner ring will expand and the outer ring will contract; **thus reducing the bearings' internal clearance**. The amount of expansion or contraction varies depending on the shape of the bearing, the shape of the shaft or housing, dimensions of the respective parts, and the type of materials used. The differential can range from **approximately 70 to 90 % of the effective interference**. Therefore, the reduced amount of clearance due to fitting is expressed by formula (5.2).

$$\delta_f = (0.70 \text{ to } 0.90)\Delta d_{eff} \quad \cdots\cdots\cdots\cdots\cdots (5.2)$$

Where:

δ_f : Reduced amount of clearance due to interference, mm
Δd_{eff} : Effective interference, mm

(2) Reduced internal clearance due to inner/outer ring temperature difference

During operation, normally the outer ring will range from 5 to 10 °C cooler than the inner ring or rotating parts. However, if the cooling effect of the housing is large, the shaft is connected to a heat source, or a heated substance is conducted through the hollow shaft; the temperature difference between the two rings can be even greater. **The amount of internal clearance is thus further reduced** by the differential expansion of the two rings. The reduced amount is expressed by formula (5.3).

$$\delta_t = \alpha \cdot \Delta T \cdot D_o \quad \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots (5.3)$$

Where:

δ_t : Reduced amount of clearance due to temperature differential of inner and outer rings, mm
α : Linear thermal expansion coefficient of bearing material, 12.5×10^{-6}/°C
ΔT: Inner/outer ring temperature differential, °C
D_o: Outer ring raceway diameter, mm

Outer ring raceway diameter, D_o, values can be approximated by using formula (5.4) or formula (5.5).

For ball bearings and spherical roller bearings,

$$D_o = 0.20(d+4.0D) \quad \cdots\cdots\cdots\cdots\cdots\cdots (5.4)$$

For roller bearings (except spherical roller bearings),

$$D_o = 0.25(d+3.0D) \quad \cdots\cdots\cdots\cdots\cdots\cdots (5.5)$$

d : Bearing bore diameter, mm
D : Bearing outside diameter, mm

For the ULTAGE™ series bearings, consult **NTN** Engineering.

Note that the formula in item 5.2.2 only applies to steel bearings, shafts and housings.

Note: For nominal bearing bore diameter d exceeding 1 000 mm, the **NTN** standard is followed.

5.3 Necessary minimum load

In general, when a bearing is operated under no load or a very light load, slippage may occur between the rolling element and the raceway.

Therefore, it is necessary to apply a minimum load to prevent slippage during bearing operation. A rough standard for the necessary minimum radial loads for radial bearings is shown below.

Ball bearings
(except self-aligning ball bearings): $0.023C_{0r}$
Self-aligning ball bearings : $0.018C_{0r}$
Roller bearings : $0.040C_{0r}$

Where:

C_{0r}: Basic static load rating, N

* Consult with **NTN** Engineering for the necessary minimum axial loads for thrust bearings.

6. Lubrication

6.1 Purpose of lubrication

The purpose of rolling bearing lubrication is to prevent direct metallic contact between the various rolling and sliding elements. This is accomplished through the formation of a thin oil (or grease) film on the contact surfaces. Lubricant is necessary for operating rolling bearings. For rolling bearings, lubrication has the following advantages:

(1) **Reduction** of **friction** and **wear**
It prevents direct metallic contact between the rolling and sliding elements of bearing components and reduces friction and wear.

(2) **Prolonged** bearing **life**
The rolling fatigue life is prolonged by forming an oil film on the rolling contact surface part.

(3) **Friction heat dissipation** and cooling
Circulating lubrication can dissipate heat generated from friction or conducted from the outside.

(4) Others
It **prevents foreign materials from entering** inside the bearing and suppresses corrosion (rust) by covering the bearing surface with oil.

In order to exhibit these effects, a lubrication method that matches service conditions is required. In addition to this, a quality lubricant must be selected, the proper amount of lubricant must be used and the bearing must be designed to prevent foreign matter from getting in or lubricant from leaking out. If lubrication is insufficient, friction is not reduced, causing excessive rise in bearing temperature or abnormal wear. Therefore, an appropriate lubrication and lubrication method should be selected.

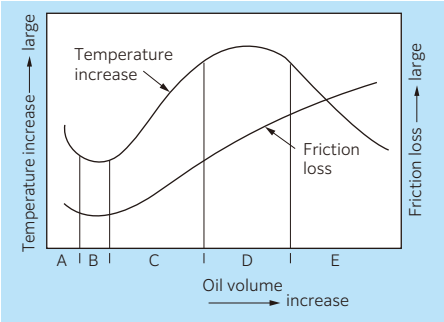

Fig. 6.1

Fig. 6.1 shows the relationship between oil volume, friction loss, and temperature rise. **Table 6.1** details the characteristics of this relationship.

Table 6.1 Oil volume, friction loss, and temperature increase (see Fig. 6.1)

Range	Characteristics	Lubrication method
A	When oil volume is extremely low, direct metallic contact occurs in places between the rolling elements and raceway surfaces. Bearing abrasion and seizing may occur.	——
B	A thin oil film develops over all surfaces, friction is minimal and bearing temperature is low.	Grease lubrication Oil mist Air-oil lubrication
C	As oil volume increases, heat buildup is balanced by cooling.	Circulating lubrication
D	Regardless of oil volume, temperature increases at a fixed rate.	Circulating lubrication
E	As oil volume increases, cooling dominates and bearing temperature decreases.	Forced circulation lubrication Oil jet lubrication

6.2 Lubrication methods and characteristics

Lubrication methods for bearings can be roughly divided into **grease** and **oil lubrication**. Each of these has its own features, so the lubrication method that best offers the required function must be selected.

Characteristics of each method are shown in **Table 6.2**.

Table 6.2 Comparison of grease lubrication and oil lubrication characteristics

Concern \ Method	Grease lubrication	Oil lubrication
Handling	◎	△
Reliability	○	◎
Cooling effect	×	○ (Circulation necessary)
Seal structure	○	△
Power loss	○	○
Environment contamination	○	△
High-speed rotation	×	○

◎ : Very good ○ : Good △ : Fair × : Poor

6.3 Grease lubrication

Grease lubricants are relatively easy to handle and require only the simplest sealing devices. For these reasons, grease is the most widely used lubricant for rolling bearings. It is used in a bearing that is pre-sealed with grease (sealed/shielded bearing), or if using an unsealed bearing, fill the bearing and housing with the proper amount of grease, and replenish or change the grease regularly.

With sealed bearings, the proper grease amount does not cause leakage; however, under use conditions including a lot of vibrations, which cause grease to flow easily, or under high speed outer ring rotation, in which a large centrifugal force is applied on the grease, the grease may purge (in rare cases). Please consult **NTN** Engineering.

6.3.1 Types and characteristics of grease

Lubricating grease is composed of either a mineral base oil or a synthetic base oil. **To this base a thickener and other additives are added**. The properties of all greases are mainly determined by the kind of base oil used and by the combination of thickening agent and various additives. **Table 6.5** shows general grease varieties and characteristics, and **Table 6.6** shows grease brand names and their characteristics (refer to page A-52 and page A-53). As performance characteristics of even the same type of grease will vary widely from brand to brand, **it is necessary to check the manufacturers' data when selecting grease**.

(1) Base oil
Mineral oil or synthetics such as **ester oil**, **synthetic hydrocarbon oil**, or **ether oil** are used as the base of greases.

Generally, greases with low viscosity base oils are best suited for low temperatures and high speeds; grease using high viscosity base oil has superior high temperature and heavy load characteristics.

(2) Thickening agents
Thickening agents are compounded with base oils to maintain the semi-solid state of the grease. Thickening agents consist of two types of bases: metallic soaps and non-soaps. Metallic soap thickeners include: **lithium**, **sodium**, **calcium**, etc. Non-soap base thickeners are divided into two groups: inorganic (**silica gel**, **bentonite**, etc.) and organic (**polyurea**, **fluorocarbon**, etc.). The various special characteristics of a grease, such as **limiting temperature range**, **mechanical stability**, water resistance, etc., depend largely on the type of **thickening agent used**. For example, a sodium based grease is generally poor in water resistance properties, while greases with bentone, polyurea and other non-metallic soaps as the thickening agent are generally superior in high temperature properties.

(3) Additives
Various additives are added to grease depending on the purpose. Typical additives include **anti-oxidants**, **high-pressure additives** (EP additives), **rust preventives**, and **anti-corrosives**. For bearings subject to heavy loads and/ or shock loads, grease containing high-pressure additives should be used. Antioxidants are added to grease used in most types of rolling bearings.

(4) Consistency
Consistency is an index that indicates hardness and fluidity of grease. **The higher the NLGI number, the HARDER the grease is**. For the lubrication of rolling bearings, greases with the NLGI consistency numbers of 1, 2, and 3 are used. General relationships between consistency and application of grease are shown in **Table 6.3**.

Table 6.3 Consistency of grease

NLGI consistency No.	JIS [ASTM] 60 times blend consistency	Application
0	355 - 385	For centralized greasing use
00	400 - 430	For centralized greasing use
1	310 - 340	For general use and sealed bearing use
2	265 - 295	For general use, high temperature use, and sealed bearing use
3	220 - 250	
4	175 - 205	For special use

(5) Mixing different types of greases
When greases of different kinds are mixed together, the consistency of the greases will change (usually softer), the operating temperature range will be lowered, and other changes in characteristics will occur. **As a rule, grease should not be mixed with grease of any other brand.** However, if different greases must be mixed, at least greases with the same base oil and thickening agent should be selected.

6.3.2 Amount of grease

The amount of grease used in any given situation will depend on many factors relating to the size and shape of the housing, space limitations, bearing's rotating speed and type of grease used. As a rule of thumb, **bearings should be filled to 30 to 40 % of their space** and **housing should be filled to 30 to 60 %**. Where speeds are high and temperature rises need to be kept to a minimum, a reduced amount of grease should be used. **Excessive amounts of grease cause temperature rises which in turn cause the grease to soften and may allow leakage. Oxidation and deterioration of excessive grease fills may cause the lubricating efficiency to be lowered.** Moreover, the standard bearing space can be found by formula (6.1).

$$V = K \cdot W \quad \cdots\cdots (6.1)$$

Where:

V : Quantity of bearing space open type (approx.), cm^3

K : Bearing space factor (see **Table 6.4**)

W : Mass of bearing, kg

A predetermine amount of grease is filled in the bearing with a grease gun or a syringe. After sealing it is not possible to spread the grease by hand - only by rotating the bearing by hand.

Table 6.4 Bearing space factor K

Bearing type 1)			Cage type	K
Deep groove ball bearings 2)			Pressed cage	61
Angular contact ball bearings			Pressed cage	54
			Machined cage	33

1) Does not apply to model numbers that are not specified in the catalog.
2) Does not apply to 160 series bearings.
3) Does not apply to NU4 series.
4) Applies to G1 machined cages only.
5) Does not apply to N4 series.

6.4 Solid grease

"Solid grease" is a lubricant composed mainly of lubricating grease and ultra-high polymer polyethylene. Solid grease begins as grease that has the same viscosity as a more traditional grease. After being heated and cooled, a process known as "calcination", the grease hardens while maintaining a large quantity of lubricant within the polymer structure. The result of this solidification is that the grease does not easily leak from the bearing, even when the bearing is subjected to strong vibrations or centrifugal force.

Bearings with solid grease are available in two types: the spot-pack type in which solid grease is injected into the cage, and the full-pack type in which all free space around the rolling elements is completely filled with solid grease.

Spot-pack solid grease is available for deep groove ball bearings, small diameter ball bearings, and bearing units. Full-pack solid grease is available for self-aligning ball bearings and spherical roller bearings. Grease filling examples are shown in **Fig. 6.2** and **Fig. 6.3**.

Primary advantages:

(1) Minimal grease leakage

(2) Low bearing torque with spot-pack type solid grease

For details, see the special catalog "**Bearings with solid grease (CAT. No. 3022/E)**".

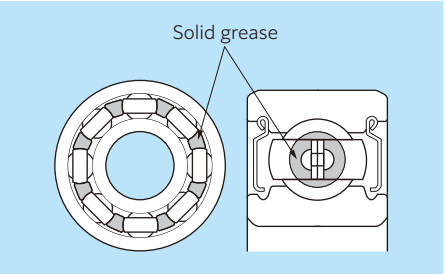

Fig. 6.2 Deep groove ball bearing with spot-pack solid grease (ZZ shield) (Available for deep groove ball bearings)

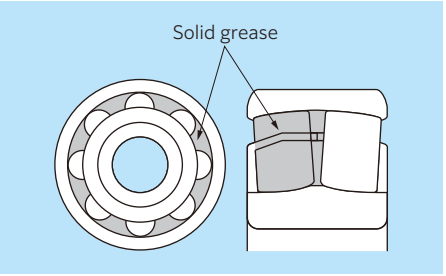

Fig. 6.3 Spherical roller bearing with full-pack solid grease (Available for spherical roller bearings)

Table 6.5 Grease varieties and characteristics [1)]

	Soap-based				
	Lithium (Li) grease				Calcium (Ca) grease
Thickening agent[2)]	Li soap			Li complexed soap	Ca soap (cup grease)
Base oil[3)]	Mineral oil	Ester oil	Silicone oil	Mineral oil	Mineral oil
Dropping point °C	170 to 190	170 to 190	200 to 210	>250	80 to 100
Operating temperature range °C	−30 to 120	−50 to 130	−50 to 160	−30 to 130	−20 to 70
Mechanical stability	Good	Good	Good	Good	OK
Pressure resistance	Good	Good	Poor	Good	OK
Water resistance	Good	Good	Good	Good	Good
Characteristics/ application	Balanced performance with less disadvantages All-purpose grease	Excellent low temperature and wear characteristics Suitable for miniature and small size ball bearings	Excellent characteristics at low and high temperatures Poor load resistance	Balanced performance with less disadvantages Usable for relatively high temperature	Used for low speed and light loads Unusable for high temperature

Soap-based		Non-soap-based			
Calcium (Ca) grease	Sodium (Na) grease	Organic			Inorganic
Ca complexed soap	Na soap	Urea	Urea	PTFE	Silica gel
Mineral oil	Mineral oil	Mineral oil	Synthetic oil	Fluorinated oil	Ester oil
200 to 280	170 to 200	>260	>260	None	>260
−20 to 130	−20 to 130	−30 to 140	−40 to 180	−40 to 250	−70 to 150
Good	Good	Good to Excellent	Good to Excellent	OK to Good	Good
Good to Excellent	Good	Good to Excellent	Good to Excellent	Good	Good
Good	Poor	Good to Excellent	Good to Excellent	Good	Good
Excellent pressure resistance	Some emulsification when water is introduced Usable for relatively high temperature	Excellent water resistance and oxidation stability	Excellent water resistance and oxidation stability Used for high temperature and high speed applications	Excellent chemical resistance Used for high temperature applications	Excellent characteristics at low temperature

1) Use the grease performance as rough standards because it differs depending on the manufacturer's additive formation.
2) Na soap-based grease may be emulsified by water and high humidity conditions.
Urea-based grease may deteriorate polyfluorocarbons and rubber.
3) Ester oil-based grease may swell acrylic materials, and silicone-based grease may swell silicone materials.
Some silicone-based greases and fluorine-based greases have poor noise performance and rustproofing performance.

Table 6.6 Grease brands and their nature

Brand	Code	Thickener	Base oil	Base oil viscosity mm²/s		60 times blend consistency		Dropping point °C	Operating temperature range °C	Characteristics
				40 °C	100 °C	Representative value	NLGI No.			
Alvania Grease S2	2AS	Li soap	Mineral oil	131	12.2	283	2	181	−25 to 120	All-purpose (standard grease for deep groove ball bearings)

Cosmo Wide Grease WR3	2M	Na terephthalate	Diester + mineral oil	31.6	6	238	3	230 or above	−40 to 150	For low temperature to high temperature, all-purpose
Mobilgrease 28	9B	Bentonite	PAO	30	5.7	293	1 to 2	307	−54 to 177	MIL-PRF-81322 For low temperature to high temperature
Aeroshell Grease 7	5S	Microgel	Diester	10.3	3.1	296	1 to 2	260 or above	−73 to 149	MIL-PRF-23827C

Note: 1. Representative values are shown for the base oil viscosity, consistency, and dropping point.
2. The upper and lower limits of the operating temperature range differ depending on the usage environment and requirement specifications. Please consult with **NTN** Engineering.

6.5 Oil lubrication

Oil lubrication is suitable for applications requiring that bearing-generated heat or heat applied to the bearing from other sources be carried away from the bearing and dissipated to the outside.

Table 6.7 shows the main methods of oil lubrication.

Table 6.7 Oil lubrication methods

Lubrication method	Example	Lubrication method	Example
(Oil bath lubrication) • Oil bath lubrication is the most generally used method of lubrication, and is widely used for low to moderate rotational speed applications. • For horizontal shaft applications, oil level should be maintained at approximately the center of the lowest rolling element, according to the oil gauge, when the bearing is at rest. For vertical shafts at low speeds, the oil level should be maintained at 50 to 80% submergence of the rolling elements.		**(Disc lubrication)** • In this method, a partially submerged disc rotates and pulls oil up into a reservoir from which it then drains down through the bearing, lubricating it.	(Oil spray lubrication) • In this method, an impeller or similar device mounted on the shaft draws up oil and sprays it onto the bearing. This method can be used at considerably high speeds.		**(Oil mist lubrication)** • Using pressurized air, lubricating oil is atomized before passing through the bearing. • Due to the low lubricant resistance, this method is well suited to high speed applications.	(Drip lubrication) • In this method, oil is collected above the bearing and allowed to drip down into the housing where it becomes a lubricating mist as it strikes the rolling elements. Another version allows only slight amounts of oil to pass through the bearing. • Used at relatively high speeds for light to normal load applications. • In most cases, oil volume is a few drops per minute.		**(Air-oil lubrication)** • In this method, the required minimum amount of lubricating oil is measured and fed to each bearing at ideal intervals using compressed air. • Fresh lubricating oil is constantly fed. • Because the required oil quantity is very small, the working environment can be kept clean.	(Circulating lubrication) • Used for bearing cooling or for automatic oil supply systems in which the oil supply is centrally located. • One of the advantages of this method is that oil cooling devices and filters to maintain oil purity can be installed within the system. • In order for oil to thoroughly lubricate the bearing, oil inlets and outlets must be provided on opposite sides of the bearing.		**(Oil jet lubrication)** • This method lubricates by injecting oil under high pressure directly into the side of the bearing. This is a reliable system for high speed, high temperature or otherwise severe conditions. • Used for lubricating the bearings in jet engines, gas turbines, and other high speed equipment. • Under-race lubrication is one example of this type of lubrication.	
6.5.1 Selection of lubricating oil

Under normal operating conditions, **machine oil**, **turbine oil**, and other mineral oils are widely used for the lubrication of rolling bearings. However, for temperatures **below -30 °C** or **above 150 °C**, synthetic oils such as **ester oil**, **silicone oil**, and **fluorinated oil** are used.

For lubricating oils, viscosity is one of the most important properties and determines an oil's lubricating efficiency. If viscosity is too low, formation of the oil film will be insufficient, and damage to the rolling surface will occur. If viscosity is too high, viscous resistance will also be great, resulting in temperature increase and friction loss. In general, **for higher speed applications**, **a lower viscosity oil** should be used; **for heavier load applications**, **a higher viscosity oil** should be used.

Lubrication of rolling bearings requires dynamic viscosity shown in **Table 6.8**, which is dependent on the use conditions. **Fig 6.4** shows the relation between lubricating oil dynamic viscosity and temperature. This is used to select a lubrication oil with viscosity characteristics appropriate for the operating temperature.

For reference, **Table 6.9** lists the selection standards for lubricating oil viscosity based on bearing operating conditions.

Table 6.8 Required lubricating oil dynamic viscosity for bearings

Bearing type	Dynamic viscosity mm²/s
Ball bearings, Cylindrical roller bearings	13 or above
Spherical roller bearings, Tapered roller bearings	20 or above
Thrust spherical roller bearings	30 or above

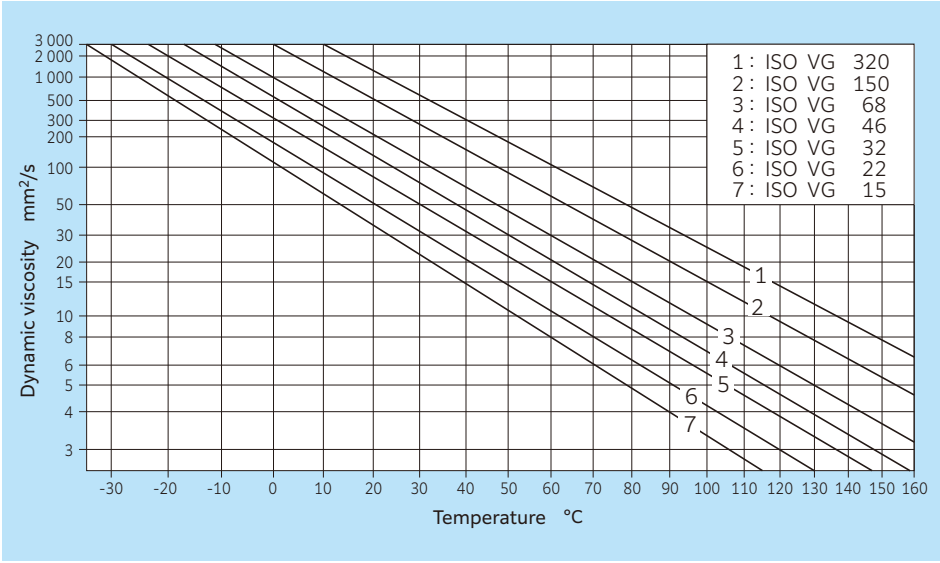

Fig 6.4 Relation between lubricating oil dynamic viscosity and temperature

Table 6.9 Standards for lubricating oil viscosity

Bearing operating temperature °C	dn-value 1)	Lubricating oil ISO viscosity grade (VG)		Suitable bearing
		Normal load	Heavy load or shock load	
−30 - 0	Up to allowable rotational speed	22, 32	46	All types
0 - 60	Up to 15 000	46, 68	100	All types
	15 000 - 80 000	32, 46	68	All types
	80 000 - 150 000	22, 32	32	All types but thrust ball bearings
	150 000 - 500 000	10	22, 32	Single row radial ball bearings, cylindrical roller bearings
60 - 100	Up to 15 000	150	220	All types
	15 000 - 80 000	100	150	All types
	80 000 - 150 000	68	100, 150	All types but thrust ball bearings
	150 000 - 500 000	32	68	Single row radial ball bearings, cylindrical roller bearings
100 - 150	Up to allowable rotational speed	320		All types
0 - 60	Up to allowable rotational speed	46, 68		Spherical roller bearings
60 - 100	Up to allowable rotational speed	150		

1) dn value: [dn = bearing bore diameter d (mm) × rotational speed n (min^{-1})]
Note: 1. Applied when lubrication method is either oil bath or circulating lubrication.
2. Please consult with **NTN** Engineering in cases where operating conditions fall outside the range covered by this table.

6.5.2 Oiling amount

When a bearing is to be supplied with oil forcibly, the amount of heat generated from the bearing is equal to the sum of the amount of heat dissipated from the housing and the amount of heat carried away by the oil.

The oiling amount that serves as a rough indication when a standard housing is used can be obtained by formula (6.2).

$$Q=K\cdot q \quad \cdots\cdots (6.2)$$

Where:

Q: oiling amount per bearing (cm^3/min)
K: coefficient determined by allowable temperature rise of oil (see **Table 6.10**)
q: oiling amount obtained by diagram (cm^3/min) (see **Fig. 6.5**)

The heat dissipation amount differs depending on the housing type. Therefore, in the actual operation, it is desirable to obtain the oiling amount suitable for the actual machine by adjusting the amount obtained by formula (6.2) to 1.5 to 2 times.

In addition, when calculating the oiling amount assuming that no heat is dissipated from the housing and the generated heat amount is completely carried away by the oil, use the shaft diameter in the diagram as d = 0.

Table 6.10 Value of K

Expelled oil temp minus supplied oil temp °C	K
10	1.5
15	1
20	0.75
25	0.6

(Example) For tapered roller bearing **30220U** mounted on a flywheel shaft with a radial load of 9.5 kN, operating at 1 800 min^{-1}, what is the amount of lubricating oil Q required to keep the bearing temperature rise below 15 °C?

d=100 mm,
dn=100×1 800=18×10^4
From **Fig. 6.5** q = 180 cm^3/min
Assume the bearing temperature is approximately equal to the expelled oil temperature,
from **Table 6.10**, since K = 1
$Q=K\times q=1\times 180=180$ cm^3/min

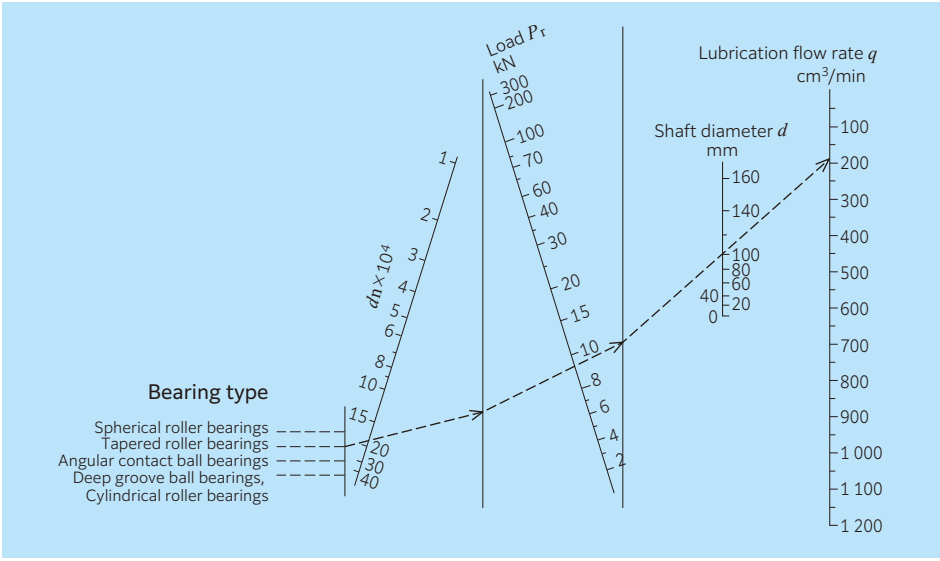

Fig. 6.5 Oil quantity guidelines

6.5.3 Relubrication intervals

The intervals at which lubricating oil should be changed varies depending upon operating conditions, oil quantity, and type of oil used. In general, for oil bath lubrication where the operating temperature is 50 °C or less, oil should be replaced once a year. When the operating temperature is between 80 to 100 °C, oil should be replaced at least once every three months. For important equipment, it is advisable that lubricating efficiency and oil purity deterioration be checked regularly to determine when oil replacement is necessary.

7. Bearing materials

7.1 Raceway and rolling element

While the contact surfaces of a bearing's raceways and rolling elements are subjected to repeated heavy stress, they must also maintain high precision and rotational accuracy.

To accomplish this, the raceways and rolling elements must be made of a material that has high hardness, is resistant to rolling fatigue, is wear resistant, and has good dimensional stability. The most common cause of fatigue in bearings is the inclusion of non-metallic inclusions in the steel. Nonmetallic inclusions contain hard oxides that can cause fatigue cracks. Clean steel with minimal non-metallic inclusions must therefore be used.

All **NTN** bearings use steel that is low in oxygen content and nonmetallic impurities, refined by a vacuum degassing process and outside hearth smelting. For bearings requiring especially high reliability and long life, steels of even higher in purity, such as vacuum melted steel (VIM / VAR) and electro-slag melted steel (ESR), are used.

7.1.1 Raceway and rolling element materials

1) High/mid carbon alloy steel

In general, steel types capable of being "**through hardened**" below the material surface are employed for raceways and rolling elements. Foremost among these is **high carbon chromium bearing steel**, which is widely used. For large type bearings and bearings with large cross sectional dimensions, induction hardened bearing steel is used, which incorporates manganese (Mn) or molybdenum (Mo). Mid-carbon steel incorporating silicon (Si) and manganese may also be used, which gives it hardening properties comparable to high carbon chromium steel.

SUJ2 is frequently used. SUJ3, with enhanced hardening characteristics containing a large quantity of Mn, is used for large bearings. SUJ5 is SUJ3 to which Mo has been added to further enhance hardening characteristics, and is used for oversized bearings or bearings with thick walls.

2) Carburizing (case hardened) steel

Carburizing hardens the steel from the surface to the proper depth, leaving a relatively soft core. This provides **hardness and toughness**, making the material **suitable for impact loads**. **NTN** uses carburizing (case hardened) steel for most of its tapered roller bearings.

In terms of case hardened steel for **NTN**'s other bearings, chromium steel and chrome molybdenum steel are used for small to medium sized bearings, and nickel chrome molybdenum steel is used for large sized bearings.

3) High temperature capable bearing steel

When bearings made of ordinary high carbon chromium steel which have undergone standard heat treatment are used for long durations at high temperatures, unacceptably large dimensional changes can occur. For this reason, **a dimension stabilizing treatment** (TS treatment) has been devised for very high temperature applications. This treatment however reduces the hardness of the material, thereby reducing rolling fatigue life (See section "1.3.2 Life adjustment factor for special bearing properties a_2" on page A-7). Note that dimensional changes can occur in normal use too.

Standard high temperature bearings for use at temperatures from **150 to 200 °C**, add silicon to the steel to improve heat resistance. This results in a bearing with excellent rolling fatigue life with minimal dimensional change or softening at high temperatures.

A variety of heat resistant steels are also incorporated in bearings to minimize softening and dimensional changes when used at high temperatures. Two of these are high speed molybdenum steel and high speed tungsten steel. For bearings requiring heat resistance in high speed applications, there is also heat resistant case hardening molybdenum steel.

4) Corrosion resistant bearing steel

For applications requiring high corrosion resistance, **stainless steel** is used. To achieve this corrosion resistance a large proportion of the alloying element chrome is added to martensite stainless steel.

5) Induction hardened steel

Besides the use of surface hardening steel, induction hardening is also utilized for bearing raceway surfaces, and for this purpose **mid-carbon steel** is mainly used for its lower carbon content instead of through hardening steel.

For deep hardened layers required for **larger bearings** and **bearings with large surface dimensions**, **mid-carbon steel is fortified with chromium and molybdenum**.

6) Other bearing materials

For ultra-high-speed applications and applications requiring very high level corrosion resistance, ceramic bearing materials such as Si_3N_4 are also available.

7.1.2 Characteristics of bearing materials

1) Dimensional change of bearings

Dimensions of bearings used for a long time may change depending on the use condition. This phenomenon is called dimensional change.

<Mechanism of dimensional change>

A standard bearing steel structure contains a small amount of austenite in the matrix of hard martensite. This austenite is partially retained austenite without being transformed into martensite in the cooling process of the bearing steel quenching process, and is called residual austenite.

Since the residual austenite is an unstable structure, it is transformed into a stable structure (martensite) when the bearing is being used. This structure transformation is the cause of the dimensional change of bearings.

Fig. 7.1 shows measured values of dimensional change of a standard bearing held at 120 °C over an extended period of time.

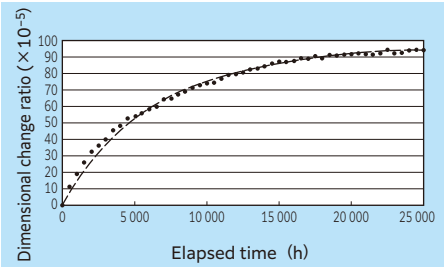

Fig. 7.1 Example of dimensional change rate of standard bearings that are held at 120 °C for a long time (measured values)

The dimensional change rate becomes larger as the elapsed time or the temperature of exposure increases.

Depending on the use condition, dimensional change may occur with bearings made of general bearing steel that did not reach 100 °C, which is the normal limit.

Bearings that underwent dimension stabilization treatment (TS treatment) have a significantly lower dimensional change. For details, please contact **NTN** Engineering.

<Dimensional change problems and countermeasures>

Among dimensional change, particular attention should be paid to inner ring expansion. When the inner ring expands by dimensional change, the interference between the inner ring and the shaft decreases, and the bearing may be heavily damaged by creeping or axial movement. Therefore, **when a bearing is to be used for a long time, the bearing specifications and fixing method must be determined with the interference decrease due to dimensional change taken into consideration.** For example, the interference can be increased (see section "4. Bearing fits") or fixing in the axial direction can be reinforced (see section "8. Shaft and housing design").

<Situations to monitor dimensional change>

The dimensional change of bearings is expressed by the bearing dimension × dimensional change rate. Therefore, under a given temperature and elapsed time, larger bearings show greater dimensional change. Pay particular attention to the amount of dimensional change when large bearings are to be used with fits with small interference.

In addition, dimensional change does not occur during the rotation inspection immediately following bearing installation. It is observed after a long-period operation. Therefore, for machines and parts used for a long time, periodic inspection is effective for preventing problems. For detailed consideration, please consult **NTN** Engineering beforehand.

7.2 Cage

Bearing cage materials must have the strength to withstand rotational vibrations and shock loads. These materials must also have a low friction coefficient, be lightweight, and be able to withstand bearing operating temperatures.

7.2.1 Metal materials

For **small** and **medium-sized bearings**, pressed steel cages of **cold** or **hot rolled material** with a low carbon content of approx. 0.1 % are used. However, depending on the application, **austenitic stainless steel** is also used. Machined cages are generally used for **large bearings. Carbon steel for machine structures** or **high-strength cast brass** is frequently used for the cages.

7.2.2 Resin materials

Recently resin cages are used in place of metals because the material is lightweight and easy to mold into complicated shapes. On the other hand, resins have disadvantages such as lower strength and heat resistance. Therefore, it is important to select resin materials that take advantage of their characteristics.

The resin materials are rarely used without being filled, and are usually reinforced with glass fiber (GF) or carbon fiber (CF).

[Characteristics of resin materials]

(Advantages)	(Disadvantages)
• Lightweight • High corrosion resistance • High self-lubricating performance with less abrasion powder • Low noise • Can easily be molded into complicated shapes and various designs • High productivity	• Lower strength compared with metal • Lower heat resistance compared with metal • The strength and elastic modulus largely vary widely with temperature. • The physical properties (strength) may change when resins are exposed to high temperatures for a long period. • The strength may deteriorate when resins are exposed to certain types of chemical or oils. • The thermal expansion coefficient is high, and the dimensional change is larger compared with metal.

<<Polyamide (PA): 66, 46>>

Polyamide is suitable for general cage materials because it is low cost and has high strength, heat resistance, wear resistance, and formability. This material has disadvantages such as high water absorbency, physical property deterioration and dimensional change due to water absorption. On the other hand, water absorption increases flexibility and toughness, enhancing the ease of assembly and shock resistance of cages.

However, the physical property (strength) may deteriorate rapidly at high temperatures when polyamide is exposed to lubricating oil containing an S (sulfur) type or P (phosphorus) type extreme pressure additive.

Polyamide 66 reinforced with glass fibers is the most used material because it has excellent performance as a cage material.

<<Polyphenylene sulfide (PPS)>>

Polyphenylene sulfide has high heat resistance (continuous operating temperature: 220 to 240 °C), chemical resistance, melt fluidity, and formability.

<<Polyetheretherketone (PEEK)>>

Polyetheretherketone has the highest heat resistance among thermoplastic resins (continuous operating temperature: 240 to 260 °C). It has excellent self-lubricating performance, shock resistance, and chemical resistance, but it is very expensive.

<<Fabric reinforced phenolic resin>>

Phenolic resin is a thermosetting resin. It overcomes the disadvantages of hard and brittle phenolic resin having low shock resistance using fabric reinforcement. It is lightweight and has high lubricity and good mechanical properties. Injection molding cannot be performed because of the thermosetting property, so cages are made by machining.

7.3 Rubber seal materials

Synthetic rubbers with high heat resistance and oil resistance are used as materials for seals. Different rubber is used depending on the degree of heat resistance.

<<Nitrile rubber (NBR)>>

Nitrile rubber has high oil resistance, heat resistance, and wear resistance, and is widely used as a general material for seals. The allowable temperature range is −20 to 120 °C.

<<Acrylic rubber (ACM)>>

Acrylic rubber has high heat resistance and can be used above the application temperature of NBR. It has excellent oil resistance but swells in ester oil. An ester oil resistant grade is also available. The allowable temperature range is −15 to 150 °C.

<<Fluorinated rubber (FKM)>>

Fluorinated rubber has excellent heat resistance, oil resistance, and chemical resistance. It is deteriorated by amine, so attention needs to be paid when combining fluorinated rubber with urea grease that precipitates amine at high temperatures. The allowable temperature range is −20 to 230 °C.

8. Shaft and housing design

Depending upon the design of a shaft or housing, the shaft may be influenced by an unbalanced load or other factors which can then cause large fluctuations in bearing efficiency. For example, depending on the dimensional accuracy and shape accuracy of the shaft and housing, there could be insufficient interference fit with the bearing, leading to material creep during operation. When the machining accuracy of the shaft or the housing is insufficient or when there is an error in the installation, the inner ring or the outer ring of the bearing can become misaligned. Operation under this condition may cause excessive loading at the edges of the inner and outer rings as well as rolling elements, deteriorating the fatigue life. Furthermore, chipping damage may occur on the rib face of roller bearings due to heavy contact with the rolling element end surface while operating under misalignment. A speed deferential between the rolling elements and cage may apply abnormal force to the cage, causing damage. For this reason, it is necessary to pay attention to the following when designing shaft and housing:

(1) Bearing arrangement; most effective fixing method for bearing arrangement.
(2) Selection of shoulder height and fillet radius of housing and shaft.
(3) Shape precision and fitting dimensions; runout tolerance of shoulder area.
(4) Machining precision and mounting error of housing and shaft suitable for allowable alignment angle and permissible misalignment of bearing.

When the housing rigidity is insufficient, excessive deformation of the inner and outer rings may lead to poor distribution of loading among rolling elements, causing abnormal noise and deterioration of fatigue life. Therefore, the housing requires sufficient rigidity.

When two or more bearings are to be attached to a shaft, one typically serves as a fixed end bearing and the other serves as a floating end bearing to compensate for axial mounting error and allow for thermal expansion. In addition, when two or more bearings are to be attached to a housing, the design must allow through hole machining to improve the accuracy of the housing.

8.1 Fixing of bearings

When a bearing that receives axial loads and preloads is to be attached to a shaft or a housing, an axial fixing method that is sufficient to withstand the axial loading such as a tightening nut, bolts, or snap rings should be selected because a serious problem may be caused when the raceway moves in the axial direction.

In addition, **cylindrical roller bearings (NU and N types) that are to be mainly used as floating side bearings also need to be fixed in the axial direction because the raceway may move in the axial direction when the shaft is bent by a moment load, damaging the bearing.**

Table 8.1 shows general bearing fixing methods, and **Table 8.2** shows fixing methods for bearings with tapered bores.

Table 8.1 General bearing fixing methods

Inner ring clamp	Outer ring clamp	Snap ring
		The most common method of fixing bearings in place is to use clamping nuts or bolts to hold the shaft or housing abutment against the ring end face. The tightening nuts and bolts must be fixed so that they will not be loosened by axial loads or vibration when the bearing is being used.		Use of snap rings regulated under JIS B 2804, B 2805, and B 2806, makes for a very simple construction. However, interference with chamfers, bearing installation dimensions, and other related specifications must be considered carefully. Snap rings are not suitable for applications requiring high accuracy or where the snap ring receives large axial loads.

Table 8.2 Fixing methods–bearings with tapered bores

Adapter sleeve mounting	Withdrawal sleeve mounting	Split ring mounting
		When installing bearings on cylindrical shafts, adapter sleeves or withdrawal sleeves can be used to fix bearings in place axially. The adapter sleeve is fastened in place by frictional force between the shaft and bore diameter of the sleeve.		For installation of tapered bore bearings directly on tapered shafts, the bearing is held in place by a split ring inserted into a groove on the shaft, and is fixed in place with a split ring nut or screw.

8.2 Bearing fitting dimensions

8.2.1 Abutment height and fillet radius

The shaft and housing **abutment height** (h) should be **larger than the bearings' maximum allowable chamfer dimensions** ($r_{s\ max}$), such that the abutment directly contacts the flat part of the bearing end face. The **fillet radius** (r_a) must be **smaller than the bearing's minimum allowable chamfer dimension** ($r_{s\ min}$) so that it does not interfere with bearing seating.

Table 8.3 lists abutment height (h) and fillet radius (r_a). For bearings to be subjected to very large axial loads, shaft abutments (h) should be higher than the values in the table.

Table 8.3 Fillet radius and abutment height

Unit: mm

$r_{s\ min}$	$r_{as\ max}$	h (Min.)	
		Normal use[1]	Special use[2]
0.05	0.05	0.3	
0.08	0.08	0.3	
0.1	0.1	0.4	
0.15	0.15	0.6	
0.2	0.2	0.8	
0.3	0.3	1.25	1
0.6	0.6	2.25	2
1	1	2.75	2.5
1.1	1	3.5	3.25
1.5	1.5	4.25	4
2	2	5	4.5
2.1	2	6	5.5
2.5	2	6	5.5
3	2.5	7	6.5
4	3	9	8
5	4	11	10
6	5	14	12
7.5	6	18	16
9.5	8	22	20
12	10	27	24
15	12	32	29
19	15	42	38

1) If a bearing supports a large axial load, the height of the shoulder must exceed the value given here.
2) Used when an axial load is light. These values are not suitable for tapered roller bearings, angular contact ball bearings and spherical roller bearings.
Note: $r_{as\ max}$ indicates maximum allowable fillet radius.

8.2.2 For spacer and ground undercut

In cases where a fillet radius ($r_{a\ max}$) larger than the bearing chamfer dimension is required to strengthen the shaft or to relieve stress concentration [see **Fig. 8.1(a)**], or abutment height is too low to afford adequate contact surface with the bearing [see **Fig. 8.1(b)**], the use of a spacer may be beneficial.

Relief dimensions for ground shaft and housing fitting surfaces are given in **Table 8.4**.

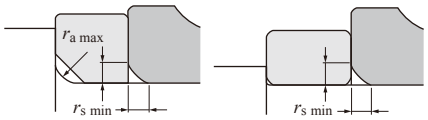

Fig. 8.1 Bearing mounting with spacer

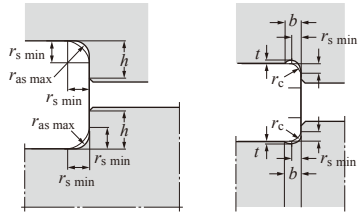
Table 8.4 Relief dimensions for ground shaft

Unit: mm

$r_{s\ min}$	Relief dimensions		
	b	t	r_c
1	2	0.2	1.3
1.1	2.4	0.3	1.5
1.5	3.2	0.4	2
2	4	0.5	2.5
2.1	4	0.5	2.5
2.5	4	0.5	2.5
3	4.7	0.5	3
4	5.9	0.5	4
5	7.4	0.6	5
6	8.6	0.6	6
7.5	10	0.6	7



8.2.3 Fitting dimensions for thrust bearings

For thrust bearings, it is necessary to make the raceway washer back face sufficiently wide in relation to load and rigidity. Consequently, fitting dimensions from the dimension tables should be adopted (see **Fig. 8.2** and **Fig. 8.3**).

For this reason, **shaft and abutment heights will be larger than for radial bearings** (Refer to dimension tables for all thrust bearing fitting dimensions).

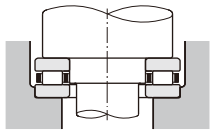


Fig. 8.2

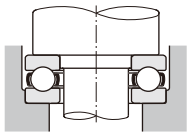

Fig. 8.3

8.3 Shaft and housing accuracy

Table 8.5 shows the required accuracies for shaft and housing fitting surface dimensions and configurations, as well as fitting surface roughness and abutment squareness for normal operating conditions.

Table 8.5 Shaft and housing accuracy

Concern		Shaft	Housing
Dimensional accuracy		IT6(IT5)	IT7(IT5)
Roundness (max.) Cylindricity		IT3	IT4
Abutment squareness		IT3	IT3
Fitting surface roughness Ra	Small size bearings	0.8	1.6
	Mid-large size bearings	1.6	3.2

Note: For precision bearings (P4, P5 accuracy), it is necessary to improve the circularity and cylindricity accuracies in this table to approximately 50 % of these values. For details, see the special catalog "**Precision Rolling Bearings (CAT. No. 2260/E)**".

Bearing Data Table of Contents

NTN

NTN New Generation Bearings (ULTAGE™ series)

Introduction of ULTAGE™ series

"ULTAGE™" (a name created from the combination of "ultimate", signifying refinement, and "stage", signifying **NTN**'s intention that this series of products be employed in diverse applications) is the general name for **NTN**'s new generation of rolling bearings that are noted for their industry-leading performance.
NTN is developing and expanding the ULTAGE™ series of each bearing type. Please see the introductory article on the following pages. The corresponding dimensions are specified in the dimension tables of each bearing type.
For details, see the following **NTN** catalogs.

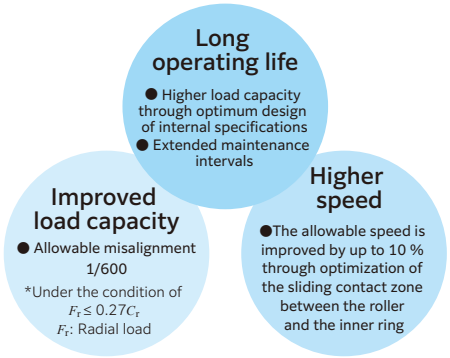
ULTAGE™ series large size tapered roller bearings [Metric] CAT.No.3035/E
ULTAGE™ series spherical roller bearings [Type EA, Type EM] ... CAT.No.3033/E

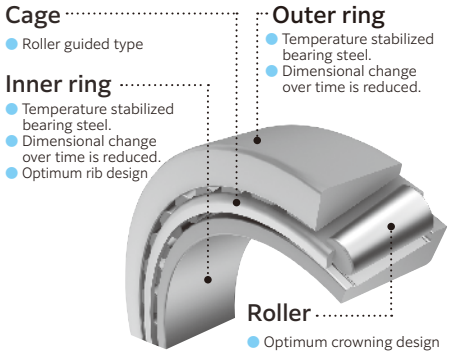
The following ULTAGE™ series bearings for special applications are also available.
For further details, please refer to the section of "C. Special Application Bearings".

ULTAGE™ series sealed four-row tapered roller bearings for rolling mill roll necks [CROU-LL type]
ULTAGE™ series sealed spherical roller bearings [WA type]
ULTAGE™ series sealed spherical roller bearings [EMLLX type]
ULTAGE™ series spherical roller bearings with high-strength cage [EMA type]

ULTAGE™ series large size tapered roller bearings [metric]

Large size tapered roller bearings (ULTAGE™ metric series with an outside diameter of ϕ270 mm or more) are the products developed to meet the demands of "long operating life", "improved load capability", and "higher speed" required for various industrial machinery.





Features

1. Long operating life

The optimization of internal specifications and industry leading load ratings have led to higher load capacities and longer operating lives.

(1) Rating life: 1.6 times longer (compared to conventional **NTN** products)

(2) Basic dynamic load rating: 16 % larger (compared to conventional **NTN** products)

2. Improved load capacity

Allowable misalignment (single row): 1/600

Optimization of the roller crowning has allowed a combination of heavy loads ($0.27C_r$) and allowable misalignment of 1/600.

Necessary minimum load: $0.04C_{0r}$

Fig. 1 shows the contact stress distribution of rollers considering an applied radial load of $F_r \leq 0.27C_r$. By optimizing the roller crowning, the edge stress is greatly reduced and the contact stress is made uniform compared with conventional **NTN** products.

[Evaluation conditions]

Bearing: 30328UUTG (ULTAGE™ product)
30328U (conventional **NTN** product)

Load: $0.27C_r$

Misalignment: 1/600

* The allowable misalignment differs depending on the loads and the bearing type. Please consult **NTN** Engineering.

3. Higher speed

The allowable speed is improved by up to 10 % (compared with the conventional **NTN** products) by optimizing the sliding contact zone between the roller and the inner ring, thus reducing the rotational torque and temperature rise (see **Fig. 2**, **Fig. 3**, and **Fig. 4**).

4. Dimensional change over time

Dimensional change of bearings over time has been reduced compared with conventional **NTN** products by applying special heat treatment to bearing steel.

● Reduction in dimensional change over time
Bearing steel ratio: 1/10
Carburizing (case hardened) steel ratio: 1/4

5. Interchangeability

The boundary dimensions conform to JIS B 1512-3 and ISO 355, and the installation dimensions are the same as that of the conventional **NTN** products.

In addition, the precision also conforms to JIS B 1514-1 and ISO 492.

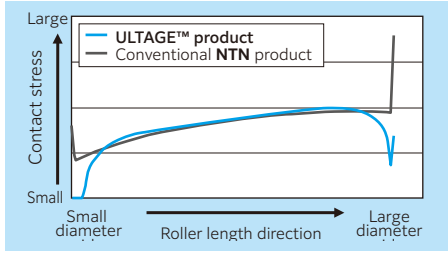


Fig. 1 Contact stress distribution of rollers

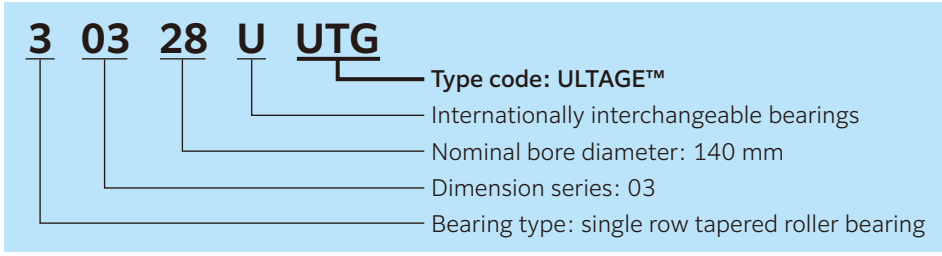
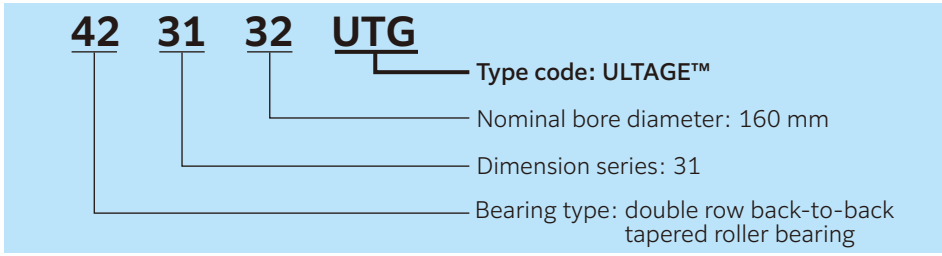
Bearing number

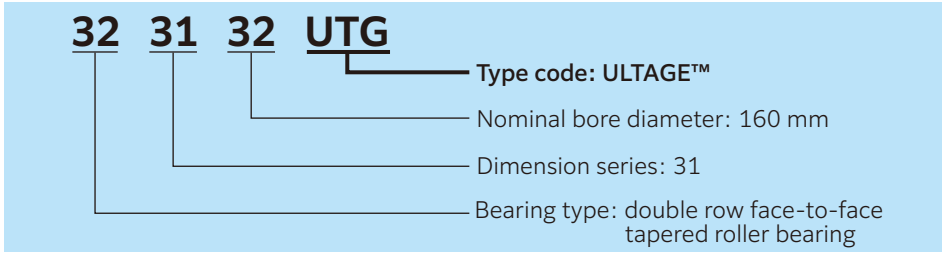
Single row tapered roller bearings



Double row back-to-back tapered roller bearings

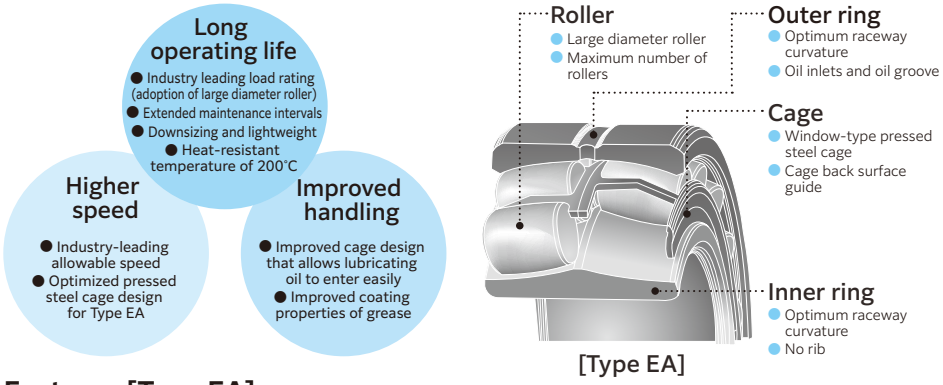


Double row face-to-face tapered roller bearings



ULTAGE™ series spherical roller bearings [Type EA, Type EM]

ULTAGE™ series spherical roller bearings are the products developed to meet the demands of "long operating life", "higher speed", and "Improved handling" that are required for various industrial machinery.



[Type EA]

Features [Type EA]

1. Long operating life

Increasing the roller diameter, maximizing the number of rollers, and industry-leading load ratings have led to higher load capacities and longer operating lives. Longer maintenance intervals can be achieved (see **Fig. 1**).

(1) Rating life: Up to 3.7 times longer (compared to conventional **NTN** products)
(2) Basic dynamic load rating: Up to 50 % higher (compared to conventional **NTN** products)
(3) Basic static load rating: Up to 35 % higher (compared to conventional **NTN** products)

2. Higher speed

Higher speed is realized through the adoption of a new pressed steel cage design.

[Allowable speed: Up to 20 % higher (compared to conventional **NTN** products)]

3. Improved handling

Adoption of the simple window-type new pressed steel cage improved the workability at the time of assembly, disassembly, and grease application.

(1) Improved application of grease to the roller surface
(2) Improved roller retention contributes to easier assembly/disassembly

4. Standard use of pressed steel cage

For the pressed steel cage, "window-type" with rigidity is adopted, and the roller pocket is provided with four tabs (projections) (see **Fig. 2** and **Fig. 3**).

(1) Cage back surface used for guidance.
(2) The four pocket tabs stabilize the position of rollers.
(3) The new pocket shape allows consistent supply of lubricating oil and grease to the internal bearing surfaces (see **Fig. 4**).
(4) Special surface treatment is applied to the entire surface to improve the abrasion resistance.

5. Reduced size and weight

High load capacity has allowed for downsizing and a lighter weight.

Comparison example

Bearing number	Load rating (kN)		Boundary dimension (mm)	Bearing volume (cm^3)	Mass (kg)
	C_r	C_{0r}			
22220B	350	415	ϕ100×ϕ180×46	810	4.95
22218EA	**384**	**398**	**ϕ90×ϕ160×40**	**550**	**3.34**

The volume weight and mass weight can be reduced by about 30 %.

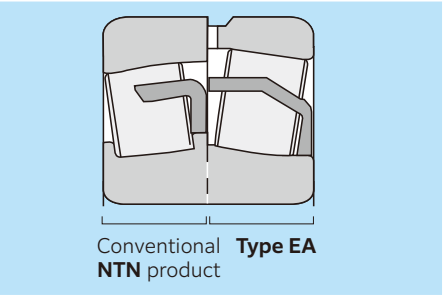


Fig. 1

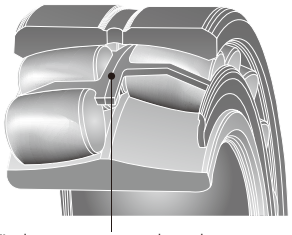
Spherical Roller Bearings

222 20 EA K D1 C3

- **Internal clearance code**
  No code: normal clearance
  C3: C3 clearance
- **Oil inlet and oil groove code**
  D1 : oil inlet and oil groove
  W33 : oil inlet and oil groove (Manufacturing in Europe)
- **External configuration code**
  No code : bore diameter cylindrical bore
  K : bore diameter tapered bore
- **Type code**
  EA : window-type pressed steel cage
  EM : one-piece high strength, machined brass cage
- **Bore diameter code**
- **Dimension series code**

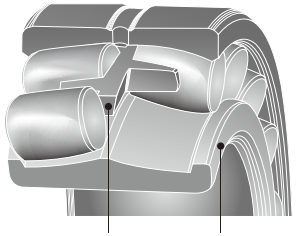
Type EM has a roller-guided one-piece machined cage and an inner ring with outboard ribs providing retention for the rollers. Type EM is particularly suitable for use in conditions subjected to severe vibrations and impacts. Internal specifications are the same as the type EA.

Type EA



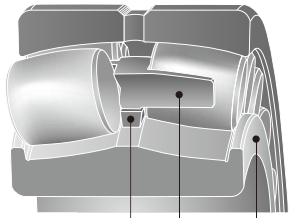
Window-type pressed steel cage

Type EM



One-piece machined cage Inner ring rib

Type EM (large size)



Guide ring One-piece machined cage Inner ring rib

[Allowable axial load]

$F_a/F_r \leq e$
F_a : Axial load
F_r : Radial load
e : Constant (see dimension table)

If this bearing type is used for a vertical shaft or under a large axial load, the load on the rollers of the row that is not subject to the axial load can become small. This small load on the rollers can result in skidding of the rollers, which can cause bearing damage. If the ratio of the radial load exceeds the factor e in the dimension table ($F_a/F_r > e$), consult **NTN** Engineering.

[Allowable misalignment]

- Normal load or more ····· 1/115
- Light load ····· 1/30

* Misalignment beyond the above limits may cause the roller to protrude from the outer ring, causing interference with the peripheral components.

Deep Groove Ball Bearings

1. Design features and characteristics

Deep groove ball bearings are very widely used. A deep groove is formed on the inner and outer ring of the bearing enabling the bearing to sustain radial and axial loads in either direction as well as the complex loads which result from the combination of these forces. Deep groove ball bearings are suitable for high speed applications.

The dimension table contains drawing numbers of various cage types and special shapes shown in **Fig. 1**.

Drawing 1 shows a pressed cage; **Drawing 2** through **Drawing 7** show machined cages. **Drawing 3** through **Drawing 6** show positions and shapes of notches in the inner ring; **Drawing 7** shows a bearing with a key groove in the inner ring.

While pressed cages are generally used, machined cages are used for larger sized bearings or bearings for high speed.

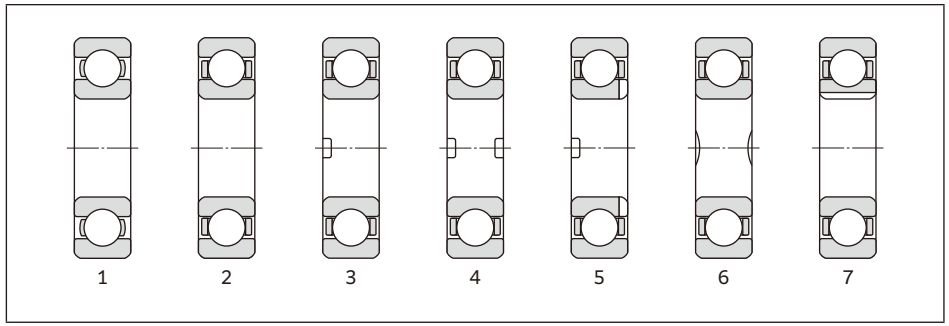


Fig. 1 Drawings of deep groove ball bearings

2. Dimensional and rotational accuracy

Refer to **Table 3.3** (pages A-18 and A-19).

3. Recommended fits

Refer to **Table 4.2** (pages A-33 and A-34).

4. Bearing internal clearance

Refer to **Table 5.2** (page A-40).

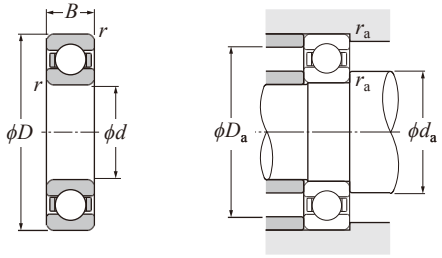
5. Allowable misalignment

1/1 500 to 1/300

6. Precautions

Slippage between the balls and raceways may occur when bearings are operated under small loads and may cause smearing. This is most apparent when a large deep groove ball bearing, in which the mass of the balls and cage is large, is used.

For additional details, please contact **NTN** Engineering.



Dynamic equivalent radial load

1) Smallest allowable dimension for chamfer dimension r.
2) For details of Drawings, please refer to **Fig. 1** on page **B-11**.
Note: Inner rings of the bearings other than the four models (**60/900**, **60/950**, **60/1000**, and **60/1060**) may have lifting holes provided during manufacturing. Please consult **NTN** Engineering before using these lifting holes.

Angular Contact Ball Bearings

1. Design features and characteristics

1.1 Angular contact ball bearing

Angular contact ball bearings are non-separable bearings with a defined contact angle in the radial direction relative to the straight line that runs through the point where each ball makes contact with the inner and outer rings. Therefore, these bearings can support, in addition to radial loads, and axial loads in one direction. Since an axial load is generated from a radial force, these bearings are generally used in pairs. **Table 1** shows classification and characteristics of duplex angular contact ball bearings.

Table 1 Duplex angular contact ball bearings—duplex types and characteristics

Duplex type	Structure	Characteristics
Back-to-back arrangement (DB)		• Can accommodate radial loads and axial loads in either direction. • Has a large distance between the acting load centers of the bearings, and therefore a large momentary force load capacity. • Allowable misalignment is small.
Face-to-face arrangement (DF)		• Can accommodate radial loads and axial loads in either direction. • Has a smaller distance between the acting load centers of the bearings, and therefore a smaller momentary force load capacity. • Has larger allowable misalignment than back-to-back duplex type.

Note: 1. Duplex angular contact ball bearings are manufactured in a set to specified clearance and preload; therefore, they must be assembled side by side with identically numbered bearings and not be mixed with other arrangements.
2. To satisfy specified clearance and preload, tightening must be performed until the inner ring width surfaces or outer ring width surfaces come in contact with each other.
3. Other combinations are also available. Please consult **NTN** Engineering for details.

1.2 Drawings of single and duplex angular contact ball bearings

The dimension table of angular contact ball bearings and duplex angular contact ball bearings contains drawing numbers of various cage types and special profiles as shown in **Fig. 1**. **Drawing 1** through **Drawing 3** and **Drawing 6** show inner ring guide cages; **Drawing 2** and **Drawing 3** show bearings with oil inlets. **Drawing 4** and **Drawing 5** show rolling element guide cages; **Drawing 5** shows a bearing with oil inlet. Note that the inner ring width in **Drawing 6** is larger than that of the outer ring.

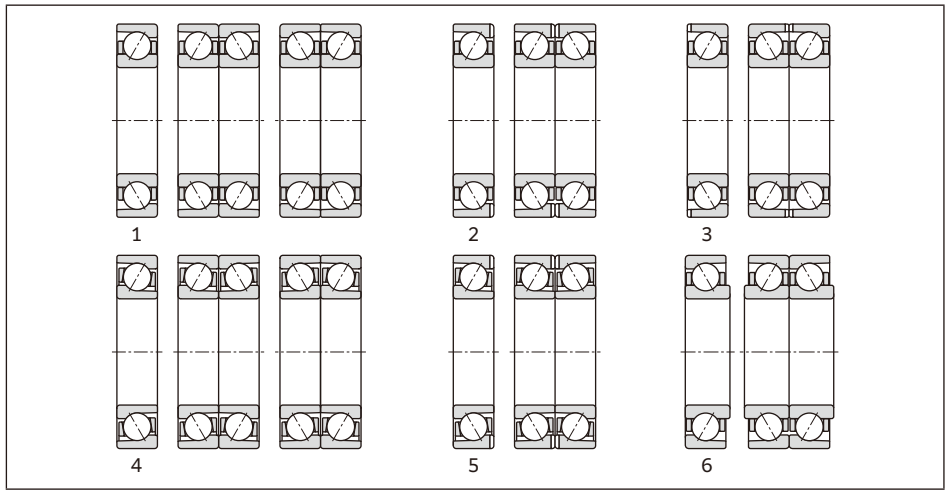

Fig. 1 Drawings of single and duplex angular contact ball bearings

1.3 Double row angular contact ball bearings

The double row angular contact ball bearings are structured by arranging two single row angular contact ball bearings back-to-back (DB) to unite their outer rings or face-to-face (DF) to unite their inner rings. These bearings support radial and axial loads in either direction: back-to-back duplexed bearings also support moment loads.

1.4 Drawings of double row angular contact ball bearings

The dimension table of double row angular contact bearings contains drawing numbers of various cage types and special shapes shown in **Fig. 2**. **Drawing 1** and **Drawing 2** show face-to-face arrangements; **Drawing 2** shows a bearing with oil inlet. **Drawing 3** through **Drawing 7** show back-to-back arrangements, representing different oil inlet locations and absence/presence of oil groove. Note that the inner ring width in **Drawing 3** is larger than that of the outer ring.

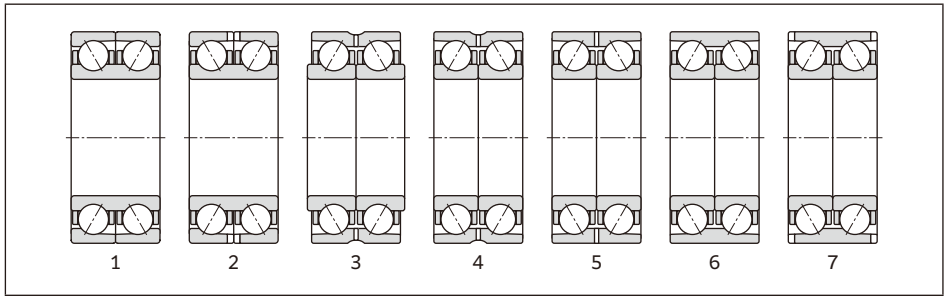

Fig. 2 Drawings of double row angular contact ball bearings

2. Dimensional and rotational accuracy

Refer to **Table 3.3** (pages A-18 and A-19) for accuracy of angular contact ball bearings.

3. Recommended fits

Refer to **Table 4.2** (pages A-33 and A-34) for recommended fits of angular contact ball bearings.

4. Bearing internal clearance

Refer to **Table 5.2** (page A-40) for bearing internal clearance of double row/duplex angular contact ball bearings.

5. Precautions

If bearing load is light during operation, or if the ratio of axial to radial load for duplex bearings exceeds the value of e, slipping may develop between the balls and raceway, sometimes resulting in smearing. This is most apparent when a large angular contact ball bearing, in which the mass of balls and cage is large, is used.

For additional details, please contact **NTN** Engineering.

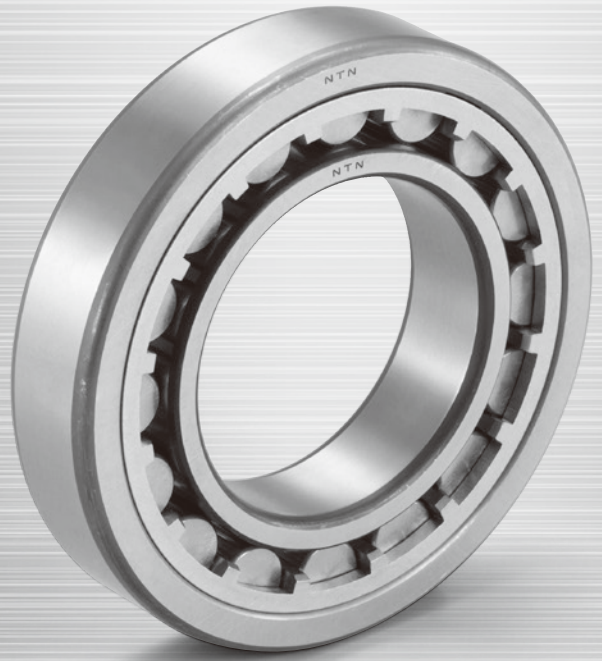
Cylindrical Roller Bearings



1. Types, design features, and characteristics

Cylindrical roller bearings can accommodate heavy radial loads due to the line contact formed between their rolling elements and raceways. These bearings are also suitable for high speed applications since the rollers are guided by either inner or outer ring ribs. Cylindrical roller bearings are separable, allowing them to be easily installed and disassembled even when interference fits are required.

Among the various types of cylindrical roller bearings other than the standard type, E type has a high load capacity while maintaining standard boundary dimensions. These bearings are classified by the number or roller rows into double row bearings, four row bearings, etc.

For extremely heavy load applications, the non-separable full complement SL-type bearing offers special advantages. For SL-type and four-row cylindrical roller bearings, see section "C. Special Application Bearings".

Table 1 shows the various types and characteristics of single row cylindrical roller bearings. **Table 2** shows the characteristics of non-standard type cylindrical roller bearings.

Table 1 Cylindrical roller bearing types and characteristics

Type code	Structure	Characteristics
NU type N type	 NU type  N type	• NU-type outer rings have two ribs. The outer ring, roller, and cage assembly can be separated from the inner ring. N-type inner rings have two ribs. The inner ring, roller, and cage assembly can be separated from the outer ring. • Unable to accommodate any axial loading. • This is widely used as the floating side bearing in a fixed-float arrangement.
NJ type NF type	 NJ type  NF type	• NJ type has two ribs on the outer ring, a single rib on the inner ring; NF type has a single rib on the outer ring, and two ribs on the inner ring. • Can receive single direction axial loads. • When there is no distinction between the fixed-side and floating-side bearing, these types can be used as a pair in close proximity.
NUP type NH type (NJ + HJ)	 NUP type  NH type	• NUP type has a collar ring attached to the ribless side of the inner ring; NH type is NJ type with an L-type collar ring attached. All of these collar rings are separable, and therefore it is necessary to fix the inner ring axially. • Can accommodate axial loads in either direction. • Widely used as the shaft's fixed-side bearing.

Remarks: Selection of bearing arrangement

In general, a shaft is supported by two bearings. A bearing that positions and fixes the shaft in the axial direction is called the "**fixed side bearing**" and a bearing that allows the axial movement is called the "**floating side bearing**". This allows expansion and contraction of the shaft due to temperature variation and absorbs errors in the bearing mounting clearance. Fixing two bearings without providing a floating side bearing applies an excessive load on bearings because of the expansion and contraction or the error, damaging the bearings at an early stage.

The **fixed side bearing** is able to support radial and axial loads. A bearing that can fix axial movement in both directions should therefore be selected. A **floating side bearing** that allows movement in the axial direction while supporting a radial load is desirable. Movement in the axial direction **occurs on the raceway surface** for bearings with separable inner and outer rings such as **cylindrical roller bearings**, and **occurs on the fitting surface** for those which are not separable, such as **deep groove ball bearings**.

When shaft expansion and contraction due to temperature fluctuations is slight, the same type of bearing may be used for both the fixed-side and floating-side bearing.

Table 2 Non-standard type cylindrical roller bearing characteristics

Designation	Characteristics
E-Type cylindrical roller bearing	• Boundary dimensions are the same as the standard type, but the diameter, length and number of the rollers have been increased, resulting in higher load capacity. • Identified by the addition of "E" to the end of the basic roller number. • Enables compact design due increased load rating. • Rollers' inscribed circle diameter differs from the standard-type rollers and therefore cannot be interchanged.  Note: In the dimension tables, both the standard type and E type are listed.
Double-row cylindrical roller bearing	• NN type and NNU type are available. • Widely used for applications requiring thin-walled bearings, such as the main shafts of machine tools, rolling machine rollers, and in printing equipment. • Internal radial clearance is adjusted for the spindle of machine tools by pressing the tapered bore of the inner ring on a tapered shaft. Remarks: For precision bearings for machine tools, see the special catalog"**Precision Rolling Bearings (CAT. No. 2260/E)**".

2. Dimensional and rotational accuracy

Refer to **Table 3.3** (pages A-18 and A-19).

3. Recommended fits

Refer to **Table 4.2** (pages A-33 and A-34).

4. Bearing internal clearance

Radial internal clearances of the cylindrical roller bearing are classified into the following two types; interchangeable radial internal clearances that allow changing the combination of inner and outer rings, and non-interchangeable radial internal clearances that do not allow changing the combination. Refer to the tables (pages) provided for each of interchangeable and non-interchangeable radial internal clearances.

Interchangeable radial internal clearance
····· **Table 5.5** (page A-41)
Non-interchangeable radial internal clearance
····· **Table 5.6** (pages A-42 and A-43)

5. Allowable misalignment

Edge loading due to misalignment under general load conditions should be avoided to prevent premature bearing failure. The maximum allowable misalignment based on bearing series can be found below. The values apply when the bearings are to be used as the floating side of NU and N types. For NJ, NUP, and NH types that are to be used for the fixed side, consult **NTN** Engineering. Depending on the magnitude of the axial load, the edge loading may exceed recommended limits, which could lead to a reduction in bearing life.

- Bearing series 0 or 1 ····· 1/1 000
- Bearing series 2 ····· 1/2 000
- Double-row cylindrical roller bearings[1)]
  ····· 1/2 000

Note: 1) Does not include high-precision bearings for machine tool main shaft applications.

6. Tolerance of inscribed circle diameter and circumscribed circle diameter of rollers of interchangeable cylindrical roller bearings

Table 3 Tolerance of inscribed circle diameter and circumscribed circle diameter of rollers of interchangeable cylindrical roller bearings

Unit: μm

Nominal bearing bore diameter d mm		Dimensional tolerance of roller inscribed circle diameter Δ_{Fw}		Dimensional tolerance of roller circumscribed circle diameter Δ_{Ew}	
Over	Incl.	Upper	Lower	Upper	Lower
50	120	+ 20	0	0	−20
120	200	+ 25	0	0	−25
200	250	+ 30	0	0	−30
250	315	+ 35	0	0	−35
315	400	+ 40	0	0	−40
400	500	+ 45	0	0	−45
500	630	+ 70	0	0	−70
630	800	+ 80	0	0	−80
800	1 000	+ 90	0	0	−90
1 000	1 250	+ 105	0	0	−105
1 250	1 400	+ 125	0	0	−125

Note: Interchangeable cylindrical roller bearings are bearings having the same number in the group. The bearing function is not impaired even if an outer ring is combined with an inner ring with rollers or an inner ring is combined with an outer ring with rollers.

7. Precautions

Slippage between the rollers and raceways may occur when bearings are operated under small loads and may cause smearing. This is most apparent when a large cylindrical roller bearing, in which the mass of the rollers and cage is large, is used.

For additional details, please contact **NTN** Engineering.

Tapered Roller Bearings

1. Types, design features, and characteristics

Tapered roller bearings are designed so the tapered vertex of the raceway surfaces of the inner and outer rings and rollers converge at one point on the centerline of the bearing (see **Fig. 1**).

The tapered rollers are guided by the combined force of the inner and outer raceway surfaces which keep the rollers pressed up against the large rib on the inner ring. Tapered roller bearings are available not only in metric series, but also inch series; both of which are widely used.

A single row tapered roller bearing can be disassembled into parts: the inner ring, rollers, and cage (collectively known as the "CONE") and the outer ring (known as the "CUP"). These are the bearing's "subunits". Subunits with standardized dimensions of the nominal cup small inside diameter and bearing contact angle in accordance with ISO and ABMA as shown in **Fig. 2** are compatible between subunits.

Typical supplementary codes used in bearing numbers of tapered roller bearings are shown in **Table 1**.

Double row and four row bearings are available in addition to single row bearings. Models and characteristics are shown in **Table 2**. For four-row tapered roller bearings, see chapter "C Special Application Bearings".

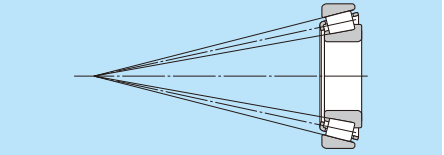

Fig. 1

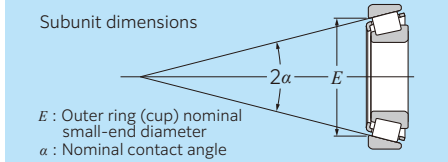

Fig. 2

Table 1 Supplementary codes

Supplementary prefix code		Supplementary suffix code	
4T-	Internationally interchangeable 4T bearings	X	Bearings having the same assembly width and inner ring width (excluding double row tapered roller bearings)
T-	Internationally interchangeable inch series bearings	U	Internationally interchangeable bearings
E-	Bearings using carburizing (case hardened) steel	XU	Internationally interchangeable bearings having the same assembly width and inner ring width (excluding double row tapered roller bearings)

Bearing number examples

4T- **T4CB100**

T-E- **HH926744/HH926710**

32020 **XU**

Supplementary suffix code

Table 2 Structure and characteristics of double row tapered roller bearings

Type	Structure	Nominal number	Characteristics
Double row back-to-back arrangement		413XXX 423XXX 430XXX 432XXX CRI	• These bearings are designed with one double row outer ring and two pairs of inner rings with rollers. These bearings are manufactured so that the internal clearance values are fixed. Due to this, only parts with identical manufacturing numbers can be used, and they must be assembled according to their code numbers. • These bearings support radial and axial loads. Since the cone pressure apex is wide, bearings are suitable where moment loads are applied. • These bearings have the same function as the back-to-back duplex arrangement of single row bearings.
Double row face-to-face arrangement		3230XX 3231XX CRD	• These bearings are designed with one double row inner ring with rollers and two pairs of outer rings and an outer ring spacer. • These bearings accept the radial and axial loads. Since the cone pressure apex is short, bearings are not suitable when the moment is applied. • As are the double row back-to-back arrangement, these bearings are manufactured so that the internal clearance values are fixed. Due to this, only parts with identical manufacturing numbers can be used, and they must be assembled according to their code numbers.
Double row steep slope face-to-face arrangement		CRD	• This bearing model has a larger and steeper contact angle than the double row with vertex of contact angles inside the bearing. These bearings are used when the axial load is large or only axials are applied. • Models without an outer ring spacer and with a key groove or notch on the inner ring (refer to the drawings in the dimension table) are also available. Consult **NTN** Engineering about this bearing's fit. • These bearings may be pressurized by using a spring between the housing shoulder and outer ring end.

2. Dimensional and rotational accuracy

Metric series bearings
····· Refer to **Table 3.4** (page A-20).
Inch series bearings
····· Refer to **Table 3.5** (page A-22).

3. Recommended fits

Metric series bearings
····· Refer to **Table 4.2** (page A-33).
Inch series bearings
····· Refer to **Table 4.5** (page A-36).
Refer to **Table 4.6** (page A-37).

4. Bearing internal clearance

Metric series bearings (double row, duplex)
····· Refer to **Table 5.7** (page A-42).
Inch series bearings (double row, duplex)
····· Refer to **Table 5.8** (page A-44).

5. Precautions

If bearing load is light during operation, or if the ratio of axial to radial load for duplex and double row bearings exceeds the value of e, slipping may develop between the rollers and raceway surface, sometimes resulting in smearing. This is most apparent when a large tapered roller bearing is used due to its large-mass rollers and cage. For additional details, please contact **NTN** Engineering.

In tapered roller bearings, the cage may protrude beyond the inner and/or outer ring side faces. Care should be taken when designing the housing and shaft to ensure contact with the cage does not occur.

1) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.

Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

2) When the value is negative "−", the load center is outside the inner ring.

1) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.

Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

2) When the value is negative "−", the load center is outside the inner ring.

1) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.

Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

2) When the value is negative "−", the load center is outside the inner ring.

Inch series

Dynamic equivalent radial load

$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \le e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_2

Static equivalent radial load

$P_{0r} = 0.5F_r + Y_0F_a$

When,

$P_{0r} < F_r$ use $P_{0r} = F_r$.

For values of e, Y_2 and Y_0 see the table below.

1) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.
Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

2) When the value is negative "−", the load center is outside the inner ring.

Inch series

Dynamic equivalent radial load

$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \le e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y_2

Static equivalent radial load

$P_{0r} = 0.5F_r + Y_0F_a$

When,

$P_{0r} < F_r$ use $P_{0r} = F_r$.

For values of e, Y_2 and Y_0 see the table below.

1) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.

Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

2) When the value is negative "−", the load center is outside the inner ring.

1) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.
Note: Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

2) When the value is negative "−", the load center is outside the inner ring.

1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Bearing numbers marked "◎" designate inch series bearings.
3) Bearing numbers marked "*" designate ULTAGE ™ series.
4) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.

5) When the value is negative "−", the load center is outside the inner ring.

1) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.
Note: Chamfer dimensions of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

2) When the value is negative "−", the load center is outside the inner ring.

1) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.
Note: Chamfer dimensions of the inner and outer rings of the bearing are larger than the maximum values of installation-related dimensions r_{as} and r_{1as}.

2) When the value is negative "−", the load center is outside the inner ring.
Note: For details on special chamfer, please contact **NTN** Engineering.

Double Row Steep Slope Face-to-Face Tapered Roller Bearings NTN

Spherical Roller Bearings

1. Types, design features, and characteristics

Spherical roller bearings consist of an outer ring having a continuous spherical raceway and two rows of barrel-shaped rollers guided by an inner ring with two raceways (see **Fig. 1**). This bearing has self-aligning properties, and therefore is suited for use where misalignment between the inner and outer rings occurs from housing installation error or shaft bending.

Spherical roller bearings have a large capacity for radial loads, axial loads in either direction, and combined loads. They are also suited for applications where vibration and shock loads are encountered. When spherical roller bearings are used with a vertical shaft or under a large axial load, the load on the rollers of the row that is not subject to the axial load becomes small, and the resulting skidding on the rollers may result in wear. If the ratio of the radial load exceeds the factor e in the dimension table ($F_a/F_r > e$), consult **NTN** Engineering.

In addition to spherical roller bearings with cylindrical bores, spherical roller bearings with tapered bores are also available. Bearings with tapered bores are specified by the suffix "K" at the end of the spherical roller bearing part number. The standard taper ratio is 1:12 for bearings with a "K" suffix; for bearings in series 240 and 241, the suffix "K30" indicates the taper ratio for a bearing is 1:30. Most tapered bore bearings incorporate the use of adapters and withdrawal sleeves for shaft mounting.

Table 1 shows the types of the spherical roller bearings.

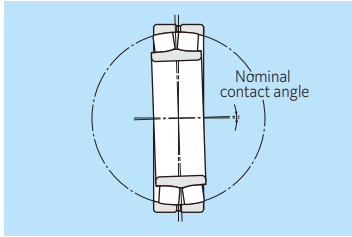

Fig. 1

2. Dimensional and rotational accuracy

Refer to **Table 3.3** (pages A-18 and A-19).

3. Recommended fits

For fits recommended for ULTAGE™ series, refer to **Table 2** and **Table 3**.

For fits recommended for non-ULTAGE™ series bearings, refer to **Table 4.2** (pages A-33 and A-34).

4. Bearing internal clearance

Refer to **Table 5.9** (pages A-46 and A-47).

5. Allowable misalignment

Spherical roller bearings have self-aligning properties. The allowable misalignment varies according to dimension series and load conditions, but the general allowable misalignment angles are listed below:

- Normal load or more:·····1/115
- Light load:·····1/30

* Misalignment beyond the above limits may cause the roller to protrude from the outer ring, causing interference with the peripheral components.

Table 1 Types of spherical roller bearings

Type	ULTAGE™ series		
	Type EA	Type EM	Type EM (large size)
Design			Bearing size	Series other than 213 type with outside diameter of 420 mm or smaller		Series with outside diameter of 440 to 580 mm
Roller	Symmetrical		
Cage type	Pressed cage	Machined cage	Machined cage
Cage shape			Max. operating temperature	200 °C		
Type	Type B	Type 213	
Design			
Bearing size	Other than ULTAGE™ series (outside diameter of 600 mm or larger)	Series with bore diameter of 55 mm or larger	
Roller	Asymmetrical	Asymmetrical	
Cage type	Machined cage	Machined cage	
Cage shape			
Max. operating temperature	120 °C (instantaneous) 100 °C (continuous)		

Table 2 Shaft tolerance class in common use (ULTAGE™ series)

Conditions		Shaft diameter (mm) Over	Incl.	Shaft tolerance class	Remarks
Cylindrical bore bearing (Class 0)					
Inner ring rotational load or load of undetermined direction	Light load [1] or Normal load [1] or Fluctuating load	60	100	n6	
		100	200	p6	
		200	500	r6	
	Heavy load [1] or Impact load	70	140	p6	Use bearings with larger internal clearances than CN clearance bearings.
		140	200[2]	r6	
Static inner ring load	Inner ring must move easily over shaft	Overall shaft diameter		g6	For large bearings, f6 will suffice to facilitate movement.
	Inner ring does not have to move easily over shaft	Overall shaft diameter		h6	
Tapered bore bearing (Class 0) (with adapter or withdrawal sleeve)					
Full load		Overall shaft diameter		h9/IT5 [3]	h10/IT7 [3] will suffice for power transmitting shafts.

1) Standards for light loads, normal loads, and heavy loads
- Light loads: dynamic equivalent radial load ≤ $0.05C_r$
- Normal loads: $0.05C_r$ < dynamic equivalent radial load ≤ $0.10C_r$
- Heavy loads: $0.10C_r$ < dynamic equivalent radial load

2) When the shaft diameter exceeds 200 mm and the bearing is to be used under heavy load or impact load conditions, please consult **NTN** Engineering.

3) The shaft shape error (roundness, cylindricity, etc.) must be within the tolerance range of IT5 and IT7.

Note: 1. All values and fits listed in the above tables are for solid steel shafts.

2. Use the formula below to calculate necessary interference. The upper limit value should not exceed 1/1 000 of the shaft diameter.
- When $F_r \leq 0.3C_{0r}$, necessary interference Δ_{dF} (μm) is $\Delta_{dF} = 0.08\,(d \cdot F_r/B)^{1/2}$
- When $F_r > 0.3C_{0r}$, $\Delta_{dF} = 0.02(F_r/B)$

[d: bearing bore diameter (mm), B: inner ring width (mm), F_r: radial load, (N), C_{0r}: basic static load rating (N)]

When the difference between the bearing temperature and the ambient temperature during bearing operation is to be considered, consider the effective interference Δ_{dT} (μm) by the temperature difference as the necessary interference.

$\Delta_{dT} = 0.0015 \cdot d \cdot \Delta T$

(ΔT: Difference between bearing temperature and ambient temperature °C)

Table 3 Housing bore tolerance class in common use (ULTAGE™ series)

Conditions				Housing bore tolerance class	Remarks
Housing	Load type, etc.		Outer ring axial direction movement		
Single housing or split housing	Static outer ring load	All types of loads	Yes	H7	G7 can be used for large bearings or bearings with large temperature differential between the outer ring and housing.
		Light [1] or normal load [1]	Yes	H8	—
		Shaft and inner ring become hot	Easily	G7	F7 can be used for large bearings or bearings with a large temperature differential between the outer ring and housing.
Single housing		Requires precise rotation under light or normal loads	As a rule, it cannot move.	K6	—
			Yes	JS6	—
		Requires low noise operation	Yes	H6	—
	Indeterminate load	Light or normal load	Yes	JS7	—
		Normal or heavy load [1]	As a rule, it cannot move.	K7	—
		High impact load	No	M7	—
	Rotating outer ring load	Light or fluctuating load	No	M7	—
		Normal or heavy load	No	N7	—
		Heavy load or large impact load with thin wall housing	No	P7	—

1) Standards for light loads, normal loads, and heavy loads
- Light loads: dynamic equivalent radial load ≤ $0.05C_r$
- Normal loads: $0.05C_r$ < dynamic equivalent radial load ≤ $0.10C_r$
- Heavy loads: $0.10C_r$ < dynamic equivalent radial load

Note: All values and fits listed in the above tables are for cast iron or steel housings.

6. Oil inlet and groove for outer ring

Both ULTAGE™ series and type B spherical roller bearings are provided with oil inlets and an oil groove (see **Fig. 2** and **Table 4**).

Type 213 does not have oil inlets and grooves. However, they can be made based on customer requests. Contact **NTN** Engineering with the bearing numbers and supplementary suffix code "D1".

If a pin to prevent outer ring rotation is necessary, contact **NTN** Engineering.

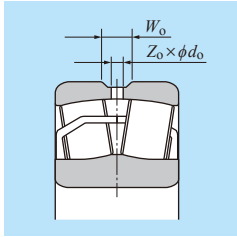

Fig. 2

Table 4 Oil inlet number

Nominal bearing outside diameter D mm		Number of oil inlets Z_o
Incl.	Below	
—	320	4
320	1 010	8
1 010	—	12

Note: For oil groove width W_o and diameter of oil inlet d_o, see the dimension table.

7. Installation of tapered bore bearings

For tapered bore spherical roller bearings, the measurement method shown in **Fig. 3** is used, and the predetermined interference is obtained when the bearing has been driven onto the shaft until the radial internal clearance reduction amount shown in **Table 5.1** [applied to ULTAGE™ series][1] and **Table 5.2** [applied to non-ULTAGE™ series] is reached.

Please treat the axial displacement drive up amounts in **Table 5.1** and **Table 5.2** as reference values only.

For conditions such as heavy loads, high speeds, or when there is a large temperature differential between inner and outer rings, etc., which require large interference fits, bearings with a minimum radial internal clearance of C3 or greater should be used and the reduction of radial internal clearance should be the maximum value shown in **Table 5.1** or **Table 5.2**. In addition, the reduction of radial internal clearance at this time must be greater than or equal to the minimum residual radial internal clearance shown in **Table 5.1** or **Table 5.2**.

Note: 1) Does not apply to ULTAGE™ series sealed spherical roller bearings [EMLLX Type]. This bearing, refer to **Table 1** (page C-15) in section "Special Application Bearings".

4) The nut rotation angle may only be applied when a nut having the same bore diameter code as the bearing is used.
5) Minimum residual radial internal clearance: Standard value of rad ial internal clearance (min.) - reduction in radial internal clearance (max.)

8. Adapters and withdrawal sleeves

Adapters are used for installation of bearings with tapered bores on cylindrical shafts (see **Fig. 4**). Withdrawal sleeves are also used to install and disassemble bearings with tapered bores onto and off of cylindrical shafts (see **Fig. 5**). In disassembling the bearing from the shaft, the nut is turned against the side face of the inner ring utilizing the bolt provided on the withdrawal sleeve, and then the sleeve is drawn away from the bearing's bore (Precision and dimensions of adapter and withdrawal sleeve are defined in JIS B 1552 and JIS B 1556).

For bearings with a bore diameter of 200 mm or more, high pressure oil (hydraulic) type adapters and withdrawal sleeves can be made to make installation and disassembly easier. As shown in **Fig. 6** construction is designed to reduce friction by injecting high pressure oil between the surfaces of the adapter sleeve and bearing inner bore by means of a pressure fitting.

If the oil supply inlet is attached in the nut side of the adapter, the supplementary suffix "HF" is added to the bearing number; if the oil supply inlet is attached on the opposite side, the suffix "HB" is added to the bearing number. For adapter sleeves, the supplementary suffix "H" is added to the bearing's number for both cases. The hydraulic sleeve nut is equipped with holes for bolts used for mounting and dismounting and holes for hydraulic piping. The suffix SP (with screw holes) or SPB (with bolts) is added to the bearing number of the nut.

For information on the hydraulic adapters and withdrawal sleeves, see the special catalog "**Adapters, Withdrawal Sleeves, Locknuts, Lockwashers & Lockplates, Hydraulic Nuts (CAT. No. 4201/E)**".

1) Smallest allowable dimension for chamfer dimension r.
2) Bearing numbers marked "*" designate **ULTAGE™ series**.
3) Bearings appended with "**K**" have a tapered bore ratio of 1:12; bearings appended with "**K30**" have a tapered bore ratio of 1:30.

Note: For type 213 bearings, outer rings with oil inlets and oil grooves can also be made based on your request.
In this case, supplementary suffix "**D1**" is added after a bearing number. Example: **21322D1**

1) Smallest allowable dimension for chamfer dimension r.
2) Bearing numbers marked "☆" designate special bearings. For details, please contact **NTN** Engineering.
3) Bearings appended with "**K**" have a tapered bore ratio of 1:12; bearings appended with "**K30**" have a tapered bore ratio of 1:30.

Thrust Bearings

1. Classification and Features

1.1 Thrust ball bearings

As shown in **Fig. 1**, balls of thrust ball bearings are arranged between a pair of raceway washers (shaft raceway washer and housing raceway washer) with a typical contact angle of 90°.

Axial loads can be supported in only one direction, and radial loads cannot be accommodated. These bearings are not suitable for high speed operation.

Table 1 shows the standard cage types.

Table 1 Standard cage types

Bearing series	511	512	513	514
Pressed cage	51120 to 51152	51220 to 51224	51320	–
Machined cage	51156 to 511/750	51226 to 51292	51322 to 51340	51420

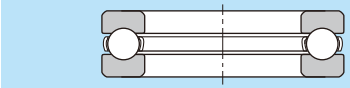

Fig. 1 Thrust ball bearing (example of pressed cage)

1.2 Thrust cylindrical roller bearings

Thrust bearings incorporating cylindrical rollers are available in single row, double row, and triple row (see **Fig. 2**).

While thrust cylindrical roller bearings are only able to receive axial loads, the axial loads can be heavy due to the high axial rigidity of the bearing.

Machined cages are used.

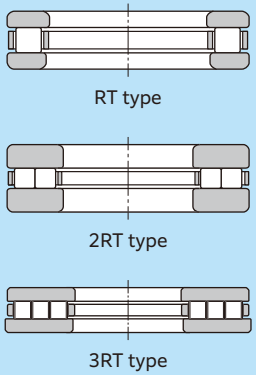

Fig. 2 Thrust cylindrical roller bearings (examples of machined cage)

1.3 Thrust tapered roller bearings

Thrust tapered roller bearings are thrust bearings using tapered rollers. Among them, the single direction type includes a ribbed housing raceway washer type [see **Fig. 3(a)**] and a ribless housing raceway washer type [see **Fig. 3(b)**], as well as a full complement roller type [see **Fig. 3(c)**]. The double direction type is mainly used to support axial loads on the roll neck of the rolling mill.

Machined cages are used.

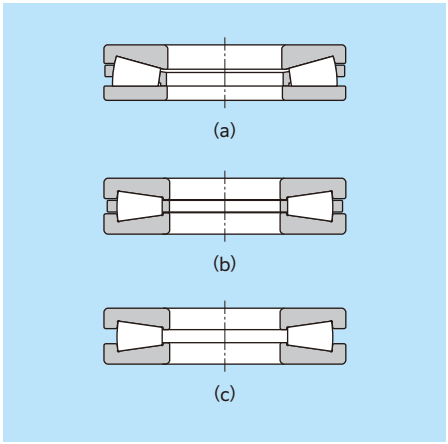

Fig. 3 Thrust tapered roller bearing (single direction type)

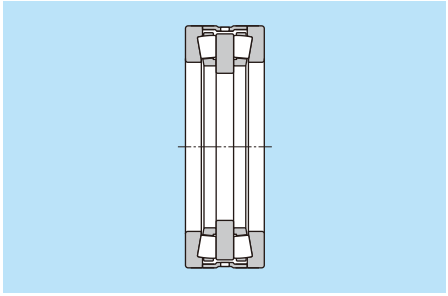

Fig. 4 Thrust tapered roller bearing (double direction type)

1.4 Thrust spherical roller bearings

Just like spherical roller bearings, the center of the spherical surface for thrust spherical roller bearings is the point where the raceway surface of the housing raceway washer meets the center axis of the bearing. Since thrust spherical roller bearings incorporate barrel-shaped rollers as rolling elements, they also have self-aligning properties (see **Fig. 5**). Under normal load conditions, allowable misalignment is 1/60 to 1/30, although this will vary depending upon the bearing's dimension series.

These bearings use machined cages. A guide sleeve for the cage is attached to the shaft raceway washer. These bearings have a high axial load capacity and, when an axial load F_a is applied, they can support a radial load F_r of a certain magnitude under the condition that $F_r/F_a \leq 0.55$.

The design for spherical thrust bearings is such that lubricant cannot enter the gap between the roller end face and the shaft raceway washer rib, between the cage and the guide sleeve, etc. Therefore, oil lubrication should be used, even in low speed operation.

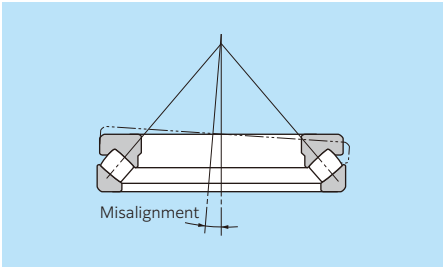

Fig. 5 Thrust spherical roller bearing

2. Dimensional and rotational accuracy

For accuracy of the thrust bearings, refer to the table (page) which provides detailed information for each bearing.

Thrust ball bearings ··· **Table 3.7** (page A-25)
Thrust cylindrical roller bearings
····· **Table 3.7** (page A-25)
Thrust tapered roller bearings
(Metric series) ····· **Table 3.9** (page A-27)
(Inch series) ····· **Table 3.10** (page A-27)
Thrust spherical roller bearing
····· **Table 3.8** (page A-26)

3. Recommended fits

For fits recommended for thrust bearings, refer to **Table 4.3** (page A-35).

4. Precautions

Thrust bearings must have a certain amount of axial load applied to them to prevent slipping between the rolling elements and axial housing raceway. Please contact **NTN** Engineering for details.

5. ULTAGE™ series thrust spherical roller bearings

ULTAGE™ series thrust spherical roller bearings are the products developed to meet the demands for "long operating life", "higher speed", and "Improved handling" required for various industrial machinery.

By adopting the simple window-type pressed steel cage, the bearings can be used with oil and grease lubrication, expanding the range of use.

For details, see the special catalog "**ULTAGE™ series Thrust Spherical Roller Bearings (CAT. No. 3034/E)**".

Special Application Bearings

Special Application Bearings Contents

NTN New Generation Bearings (ULTAGE™ series)

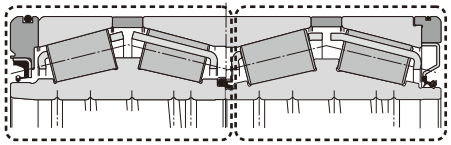
Other Bearings

The ULTAGE™ series sealed four-row tapered roller bearings [CROU-LL type] are designed to provide "high load capacity", "high load resistance performance", and "high sealing performance". These traits are required for rolling mill roll neck applications to improve reliability with a longer operating life.

1. Features

1) High load capacity

Higher load capacity and longer operating life are achieved by maximizing the size and number of rollers in the bearing.



Conventional **NTN** product | ULTAGE™ product

2) High load resistance performance

The load resistance performance has been greatly improved by making the contact stress distribution generated between the rolling elements and the raceway surface uniform.

3) High sealing performance

The ULTAGE™ series sealed four-row tapered roller bearing utilizes a specially designed fluorine rubber seal for high sealing performance, while minimizing the volume of the seal within the bearing.

Optimizing the tension force of the main seal lip and the overall design of the seal to minimize contamination ingress, reduces the internal water immersion by 50 % or more while preventing grease from flowing out from the sub lip.

Replacement of the seal on a regular basis is recommended. For details, please contact **NTN** Engineering.

4) Standard adoption of long-life grease

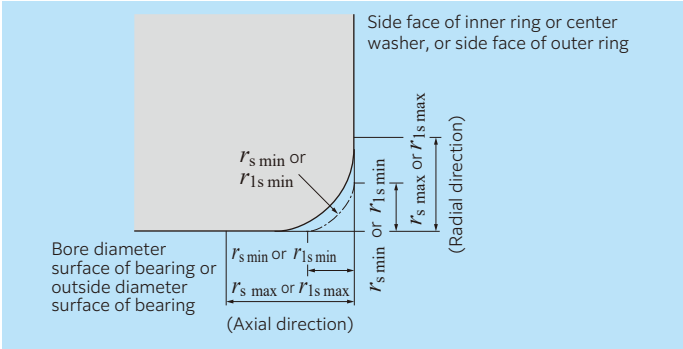
This bearing is filled with an ample amount of long-life grease to avoid the need for cleaning or filling the bearing with grease before assembling into the application.

2. Bearing number

2E- CROU- 6001 LLA1X PX1

- PX1: Tolerance code
- LLA1X: Seal code
- 6001: Bearing bore diameter code + serial code
- CROU-: Bearing type (ULTAGE™ series four-row tapered roller bearing)
- 2E-: Material code
  - 2E: Material of the inner and outer rings is carburizing (case hardened) steel. Material of the rolling elements is bearing steel.
  - E: Carburizing (case hardened) steel

3. Chamfer dimension



Unit: mm

$r_{s\,min}$ or $r_{1s\,min}$	Nominal bearing bore diameter d		$r_{s\,max}$ or $r_{1s\,max}$	
	Over	Incl.	Radial direction	Axial direction
1	50	—	1.9	3
1.5	120	250	2.8	3.5
	250	—	3.5	4
2.5	120	250	4	5.5
	250	—	4.5	6
3	120	250	4.5	6.5
	250	400	5	7
	400	—	5.5	7.5

4. Allowable temperature range

−20 to 120 °C

5. Bearing fits (recommended)

Metric series: Shaft d6/housing G7
Inch size: Contact **NTN** Engineering.

6. Standard grease fill

Grease brand: Palmax RBG (L373)
Grease amount: Space volume ratio 35 %

7. Allowable speed

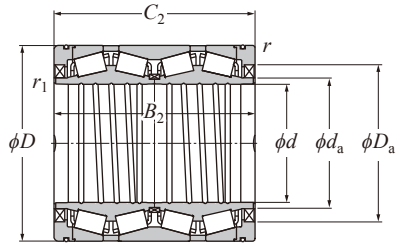
$d_m \cdot n$ value ≤ 30×10^4

d_m: Roller pitch diameter (mm) ≈ $(d + D)/2$
d : Bearing bore diameter, mm
D : Bearing outside diameter, mm
n : Rotational speed (min^{-1})

The above are approximate standard values and may not be appropriate depending on the usage condition. For details, please contact **NTN** Engineering.

8. Material

Inner and outer rings: Carburizing (case hardened) steel
Rolling elements: Bearing steel
* mark in the dimension table indicates carburizing (case hardened) steel.



Dynamic equivalent radial load

$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \le e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y_1	0.67	Y_2

Static equivalent radial load

$P_{0r} = F_r + Y_0F_a$

For values of e, Y_1, Y_2 and Y_0 see the table below.

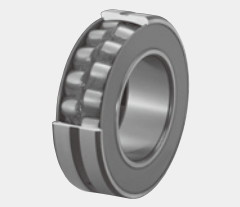
1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Consult with **NTN** Engineering because the appropriate value may change depending on the use conditions.

3) Bearing numbers marked "*" use rolling elements made of carburizing (case hardened) steel.



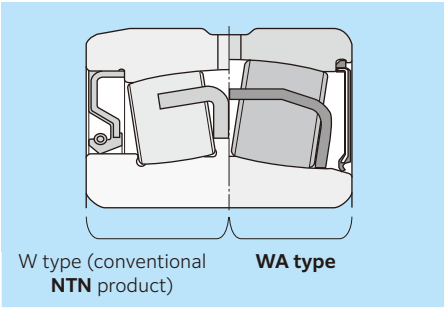
The ULTAGE™ series sealed spherical roller bearings [WA type] are designed to meet the demands of “long operating life”, “improved reliability”, and “improved handling” required for various types of industrial machinery.

1. Features

1) Long operating life
Increasing the roller diameter, maximizing the number of rollers, and industry-leading load ratings have led to higher load capacities and longer operating lives. Internal specifications are the same as the EA type.

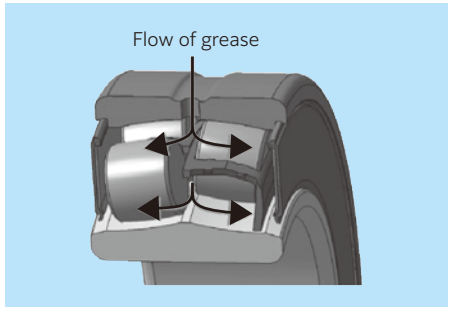
2) Improved reliability
The standard seal design is a “contact type” dust-resistant seal designed to minimize the volume of the seal within the bearing.

(1) Foreign matter intrusion is prevented by the adoption of the specially designed contact-type rubber seal.
(2) Consistent dust resistance is achieved without changing the contact surface pressure of the seal with respect to the bearing alignment.

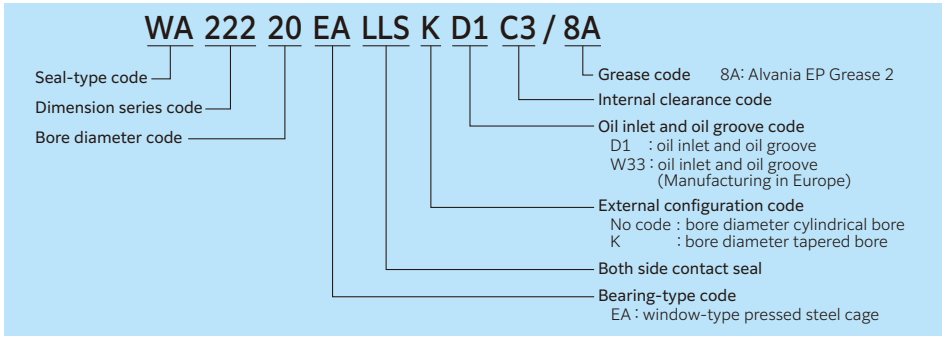


3) Improved handling
This bearing is filled with an ample amount of long-life grease to avoid the need for cleaning or filling the bearing with grease before assembling into the application.
(1) Grease brand: Alvania EP Grease 2 (8A) with extreme-pressure additive for heavy loads
(2) Grease amount: Space volume ratio 15 to 25 %

4) Standard adoption of oil inlet and groove
The bearing is able to be re-greased due to the oil inlet and oil groove that are standard in the outer ring.



2. Bearing number



3. Allowable speed

When grease is supplied : dn value ≤ 6×10^4
When no grease is supplied : dn value ≤ 8×10^4
* dn value:
dn = bearing bore diameter d (mm)× rotational speed n (min^{-1})

4. Allowable temperature range

Bearing temperature: −20 to 110 °C

5. Allowable misalignment angle

1/115

6. Allowable axial load

$F_a/F_r \leq e$
F_a : Axial load
F_r : Radial load
e : Constant (see dimension table)

If this bearing type is used for a vertical shaft or under a large axial load, the load on the rollers of the row that is not subject to the axial load can become small. This small load on the rollers can result in skidding of the rollers, which can cause bearing damage. If the ratio of the radial load exceeds the factor e in the dimension table ($F_a/F_r > e$), consult **NTN** Engineering.

7. Handling precautions

1) The radial internal clearance on a sealed spherical roller bearing cannot be measured with a clearance (thickness) gauge. Please manage the clearance after assembly by measuring the movement in the axial direction shown in **Table 5.1** (page B-183) in section “Spherical Roller Bearings”.
2) When the bearing misalignment exceeds the allowable misalignment (1/115), the rollers may come in contact with seal and cause seal deformation. It should be noted that the seal may come off when a large force is applied in this state.
3) Use Li-based mineral grease when re-greasing. If other types of grease are to be used, please contact **NTN** Engineering.
4) When temperature mounting for assembly, the bearing temperature must be 100 °C or below. The method of immersing bearings in hot oil cannot be used for this bearing type.

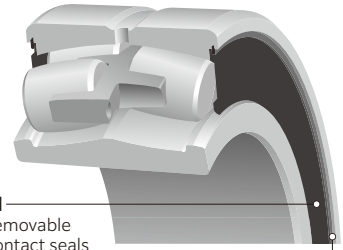
1) Smallest allowable dimension for chamfer dimension *r*.
2) "**K**" indicates bearings having a tapered bore with a taper ratio of 1:12.

The ULTAGE™ series sealed spherical roller bearings [EMLLX type] are designed to meet the demands of "long operating life", "improved reliability", and "improved handling" required for various types of industrial machinery.



1. Specifications

1) Fully compatible with open bearings

The dimensions are the same as open bearings complying with ISO dimensions, so they can replace open bearings without changing the dimensions of the surrounding parts. The allowable misalignment, 1/115, is also the same as that of open bearings (see **Fig. 1**).

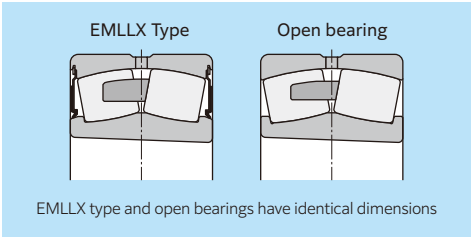


Fig. 1

2) Use of removable seals

Seals are installable, removable, and replaceable as they are held in place with a retaining ring (see **Fig. 2**).

- When installing the bearing, the radial internal clearance can be measured and adjusted accurately using a thickness gauge (see **Fig. 3**).
- The retaining rings can be installed without a special tool, and removed by inserting a flathead screwdriver or a like tool into the retaining ring notch (see **Fig. 4**).

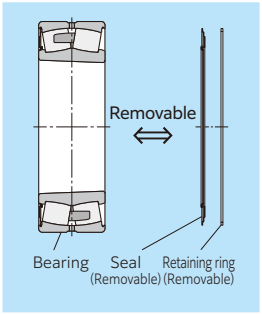

Fig. 2

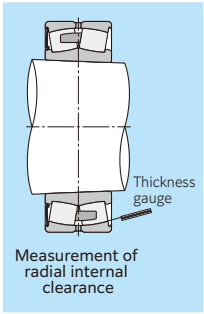

Fig. 3

3) Adoption of special thin seals

- Ensures uniform contact pressure of the seal lip during self-alignment of the bearing to prevent ingress of foreign matter and provide stable sealing.
- Provides sealed spherical roller bearings having the world's largest load capacity.

4) Lubrication spec. in accordance with requirements

Either grease-filled type or grease-free type is selectable.

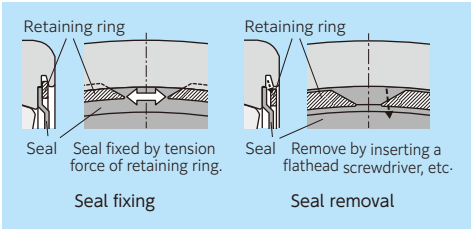

Fig. 4

2. Bearing number

231 36 EM LLX K D1 C3 / 0G V11

- V11 — Product specification code
  - V10: seals are attached on both sides.
  - V11: seal is attached on one side only. Seal is not attached on the opposite side (for tapered bore, on the smaller diameter side) but included with product.
- 0G — Lubrication code /8A : Alvania EP Grease2 /0G : No grease
- C3 — Internal clearance code
- D1 — Oil inlet and oil groove code D1: oil inlet and oil groove
- K — External configuration code No code: bore diameter cylindrical bore K : bore diameter tapered bore
- LLX — Both side contact seal
- EM — Bearing-type code EM : one-piece high strength, machined brass cage
- 36 — Bore diameter number
- 231 — Bearing series (type code + width series code + diameter series code)

* The lubricant code and the product specification code have the following combination: /8AV10 or /0GV11

3. Standard grease fill

Grease brand: Alvania EP Grease 2 (8A)
Grease with extreme-pressure additive for heavy loads is selected.

Grease amount: Space volume ratio 20 to 35 %

4. Allowable speed

dn value $\leq 6 \times 10^4$

* dn value:
dn = bearing bore diameter d (mm)× rotational speed n (min^{-1})

5. Allowable temperature range

Bearing temperature: −20 to 110 °C

6. Allowable misalignment angle

1/115

7. Allowable axial load

$F_a/F_r \leq e$
F_a : Axial load
F_r : Radial load
e : Constant (see dimension table)

If this bearing type is used for a vertical shaft or under a large axial load, the load on the rollers of the row that is not subject to the axial load can become small. This small load on the rollers can result in skidding of the rollers, which can cause bearing damage. If the ratio of the radial load exceeds the factor e in the dimension table ($F_a/F_r > e$), consult **NTN** Engineering.

8. Handling precautions

1. When assembling tapered bore bearings, maintain the reduction in radial internal clearance shown in **Table 1**.
   The reduction in radial internal clearance is the difference between the initial clearance and the clearance after assembly.
   Note that the axial displacement drive-ups in **Table 1** are for reference only.

2. When the bearing misalignment exceeds the allowable misalignment (±1/115) during handling, the rollers may come into contact with the seal and cause seal deformation. Furthermore, if additional force is applied in this state, the seal and retaining ring may come off from the bearing, so please exercise caution.

3. If a shrink fit is to be used for assembly, do not exceed a bearing temperature of 100 °C. However, the method of shrink fit by immersion in a hot oil bath cannot be used.

4. The retaining ring can be installed without special tools. Fit it in the groove in the outer ring sequentially from one end (see **Photo 1**).

5. There is a possibility that the seals or retaining rings will fall out during operation or handling of the bearing, confirm the seal and retaining ring are securely fit.

6. After assembling of the bearing, check that there is no slack in the retaining rings.

7. Remove the retaining ring by inserting a flathead screwdriver or a like tool into the retaining ring notch (see **Photo 2**).

8. When fitting or removing the seals or retaining rings, wear protective glasses for safety, and use caution when handling the retaining rings. Also, wear gloves when handling the retaining rings so as not to injure your hand or finger with the tip of the retaining ring.

9. When fitting or removing the seals or retaining rings, be careful not to damage the seals or retaining rings.

10. When supplying grease, the guideline for grease supply pressure is about 0.1 MPa. Sudden application of pressure may cause the seal or retaining ring to come off.

11. If the combination of the lubrication code and product spec. is "/8AV10", use lithium mineral grease when supplying grease. If other types of grease are to be used, please contact **NTN** Engineering.

*8A: Alvania EP Grease 2; V10: With seals already fitted on both sides

1) Smallest allowable dimension for chamfer dimension r.
2) "**K**" indicates bearings having a tapered bore with a taper ratio of 1:12.
Note: For bearing numbers not shown on of the 231 series dimension table (bore diameter over 240 mm and 420 mm or less), contact **NTN** Engineering.

ULTAGE Sealed Spherical Roller Bearings [EMLLX Type] NTN

The ULTAGE™ series spherical roller bearings with high-strength cage [EMA type] are used under harsh conditions (eccentric rotation, impact load, etc.), and were developed to meet the demands of "long operating life", "vibration resistance", and "low temperature rise" that are required for various industrial machinery.

1. Features

1) Long operating life
Increasing the roller diameter, maximizing the number of rollers, and industry leading load ratings have led to higher load capacities and longer operating lives.

2) Vibration resistance
By modifying the shape and incorporating staggered pockets, the cage has improved in both strength and vibration resistance.

3) Low temperature rise
Through the optimization of internal specifications, heat generation rates have been reduced.

4) 200 °C heat resistant specification
Special heat treatment used as standard provides excellent dimensional stability at up to 200 °C, contributing to a long operating life.

2. Accuracy and clearance (specification for vibrating screens)

The bore and outside diameter tolerance and the radial internal clearance are set for vibrating screens to obtain the desired operating clearance (see **Table 2**). For bearing specifications (accuracy, clearance, etc.) other than those for the vibrating screen, please refer to the specifications for the ULTAGE™ series spherical roller bearings.

Table 1 Type

- **Dimension series code**
- **Bearing type code** (2: spherical roller bearing)

22320EMAD1 VS1

- Specification for vibrating screens (No code indicates general bearing clearance and accuracy.)

4. Allowable axial load

$F_a/F_r \leq e$
F_a : Axial load
F_r : Radial load
e : Constant (see dimension table)

If this bearing type is used for a vertical shaft or under a large axial load, the load on the rollers of the row that is not subject to the axial load can become small. This small load on the rollers can result in skidding of the rollers, which can cause bearing damage. If the ratio of the radial load exceeds the factor e in the dimension table ($F_a/F_r > e$), consult **NTN** Engineering.

5. Allowable misalignment

Normal load or more ····· 1/115
Light load ····· 1/30

* Misalignment beyond the above limits may cause the roller to protrude from the outer ring, causing interference with the peripheral components.

1) Smallest allowable dimension for chamfer dimension *r*.

2) "K" indicates bearings having a tapered bore with a taper ratio of 1:12.

Split Cylindrical Roller Bearings

NTN

· Since the inner ring, outer ring and cage are split in two parts, it is possible to mount the bearing in places where a united bearing is difficult or impossible to mount (i.e. Places where mounting from the shaft end is impossible, an obstacle exists on the shaft, or the shaft is very long).
· These bearings also allow easy inspection and maintenance after mounting.

1) The bearings marked "∗" has an outer ring with a spherical outside surface.
2) Drawing 1 and Drawing 2 are typical examples. For details, please contact **NTN** Engineering.

Cylindrical Roller Bearings for Chain Conveyors

NTN

· Since the outer ring directly supports heavy loads, the thickness of the outer ring is designed to be thicker than regular bearings.
· For operation under heavy loads and extremely low speed rotation, these bearings are designed to be a full complement roller type and have high load capacity.
· To prevent foreign matter from entering the bearing, a labyrinth structure is applied, which has a narrower clearance between the outer ring and rib ring.

Split Cylindrical Roller Bearings for Continuous Casting Machinery (w/water cooled housings)

NTN

- These bearings are designed to be a full complement roller type and have high load capacity for heavy loads, ultra-low speed rotation and space-saving.
- These bearings provide a multi-seal with a labyrinth ring, seal ring and special rubber seal to prevent water from invading.
- The clamping ring of the inner ring is not needed anymore and the structure of direct clamping is applied to make a compact bearing.
- Bearings have a self-aligning nature due to the roll deflection since the outer ring outside surface and the housing inside surface are spherical.
- Application of a water cooling jacket-type housing controls rising bearing temperatures.

1) Smallest allowable dimension for chamfer dimension r.

Bearings for Sendzimir Rolling Mill Backup Rolls NTN

- Since bearings are directly used as backup rolls, the thickness of the outer ring is designed to be thicker than regular bearings.
- Since high accuracy under heavy loads is required, these bearings are designed to have high load capacity and high accuracy.
- Several bearings are assembled on one shaft for operation, and the mutual difference of assembled thickness (Dimension H) of bearings on the same shaft is very minimal.
- When the outer ring outside surface is worn, it is possible to recycle it by grinding it to a certain level.

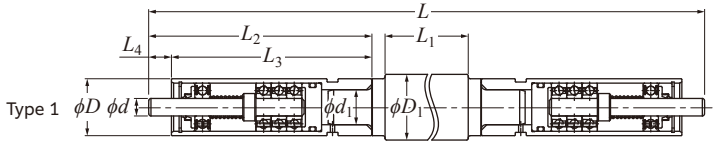
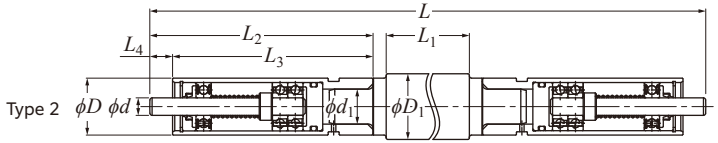
1) Smallest allowable dimension for chamfer dimension r or r_1.

Cartridge Unit

- This unit has a precision small diameter and a long scaled roll, with the surface roughness of the roll designed to be low.
- Angular contact ball bearings are assembled in multiple rows in the cartridge unit to achieve higher load capacity in both axial directions and high speed.
- This unit has established both tight sealing and low torque operation by a labyrinth structure and light-contact seals.





Roll Unit for Tension Leveler

NTN

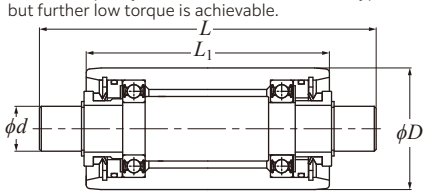
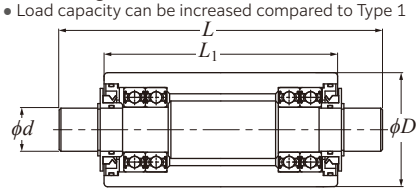
Backup Roll Unit

· This unit has established both tight sealing and low torque operation by a labyrinth structure and light-contact seals.
· When a torque lower than that of needle type (NKZ) is required, ball type (BUB), which uses only deep groove ball bearings, is available.

Type 1: Wet spec., ball type (BUB)
- Spec. with needle bearings omitted
- The load capacity is lower than that of needle type, but further low torque is achievable.



Type 2: Wet spec., ball type (BUB)
- The same spec. as Type 1, but with more deep groove ball bearings added
- Load capacity can be increased compared to Type 1



Type 3: Dry spec., ball type (BUB)
- Standard spec. for use without cleaning fluids (Dry spec.)
- Contact-seal-less spec. allows reduction in torque

Note: 1. Contact **NTN** for further information about the use of each bearing and consideration of bearing specifications.
2. Please test the bearing on an actual machine before use.

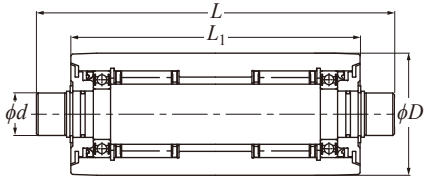
Roll Unit for Tension Leveler

NTN

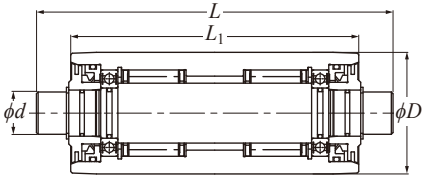
Backup Roll Unit

· Since it is used as a backup roll, the unit features high precision roll specifications with minimal runout in roundness and cylindricity, and is designed with careful consideration for the surface roughness, surface hardness, and crowning profile.

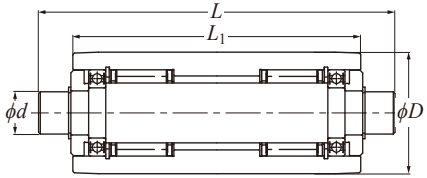
Type 4: Wet spec., needle type (NKZ)
- Spec. with seals for needle bearings
- Standard type of wet spec.



Type 5: Wet spec., needle type (NKZ)
- Spec. with V-seals (axial seals)
- Torque can be stabilized compared to Type 4



Type 6: Dry spec., needle type (NKZ)
- Standard spec. for use without cleaning fluids (Dry spec.)
- Contact-seal-less spec. allows reduction in torque



Type 7: Dry spec., needle type (NKZ)
- The same spec. as Type 6, but with labyrinth structure added upon request

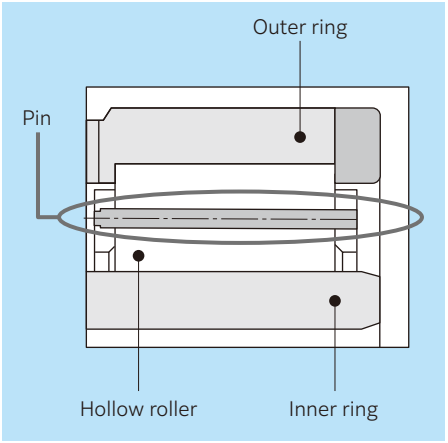
Four-row cylindrical roller bearing

1. Features

1) The bearings are mainly used in the roll necks of steel rolling mills and designed so that the load rating is maximized in the allowable space of the roll neck part.
2) The cage types include a comb-type cage and a pin-type cage (that uses hollow rollers). The pin-type cage maximizes the number of rollers in the bearing to provide increased load capacity.
3) Carburizing (case hardened) steel is used in some cases to prevent inner ring cracks and to improve shock resistance.
4) Consult **NTN** Engineering for bearing internal clearance and fits to be used for back-up rolls of rolling mills.
5) There are many varieties of these bearings, including bearings which are sealed, have tapered bores, designed for high speed, have creep prevention, etc. Contact **NTN** Engineering for further details.



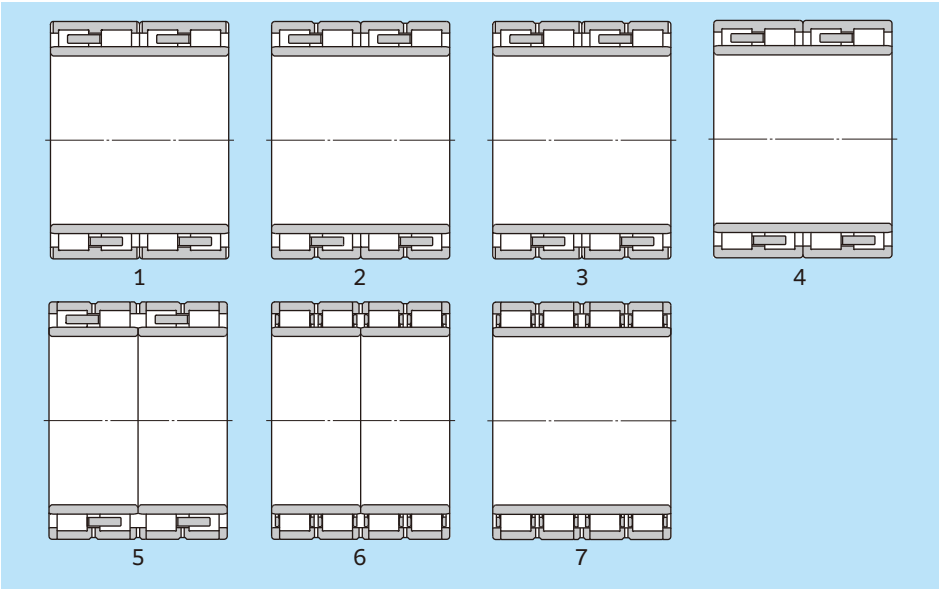
Pin-type cage

2. Types

Drawing 1 through **Drawing 7** show the several types of four-row cylindrical roller bearings that differ by the basic structure of inner rings, outer rings, and outer ring spacers.

The dimension table has the identification code (Drawing + suffix code + oil groove code) specified in the Drawing number column.

Example) In the case of Drawing: 6, suffix code: M, oil groove code: (1), identification code "6M(1) " is specified in the Drawing number column.



Drawings

Identification code	**See the above Drawings 1 to 7.** ∗ Drawings 1 to 5 use solid rollers + comb-type machined cage. ∗Drawings 6 to 7 use hollow rollers + pin-type cage. **Suffix code** M : The oil inlet of the outer ring is provided with a fitting nozzle for oil mist. R : The bore diameter surface of the inner ring has a helical groove. S : Special specification **Oil groove code** ①: Oil groove on both side faces of inner ring ②: Oil groove on one width surface of inner ring ③: Oil groove on one width surface of outer ring ④: No oil inlet or oil groove on outer ring spacer

1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Refer to section "2. Types" on page **C-33** for details of drawings.

Four-Row Cylindrical Roller Bearings NTN

Four-row tapered roller bearing

1. Features

1) This type of bearing includes two double-row inner rings with rollers, one double-row outer ring, two single-row outer rings, and two outer ring spacers (see **Fig. 1** TYPE B). There is also a type with an inner ring spacer (see **Fig. 1** TYPE A). These bearings are manufactured so that the internal clearance values are fixed. Due to this, only parts with identical manufacturing numbers can be used, and they must be assembled according to their code numbers.

2) These bearings are mainly used in the roll necks of steel rolling mills and designed so that the load rating is maximized in the allowable space of the roll neck part.

3) Loose fitting is used to make the assembly and removal of the bearings easy. Carburizing (case hardened) steel is used to prevent inner ring cracks due to creeping and to improve shock resistance. There is also a bearing design with a helical groove in the inner ring bore to prevent wear.

4) The cage type includes a pressed steel cage and a pin-type cage (that uses a hollow roller as shown in **Fig. 2**). The pin-type cage maximizes the number of rollers in the bearing to provide increased load capacity.

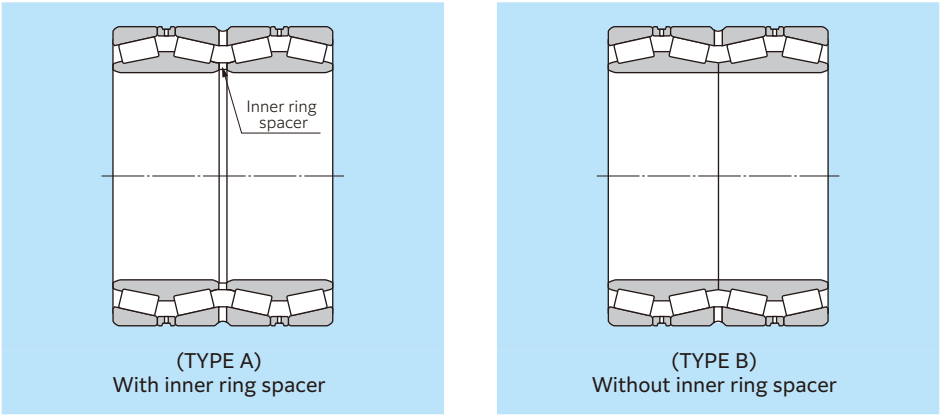

Fig. 1

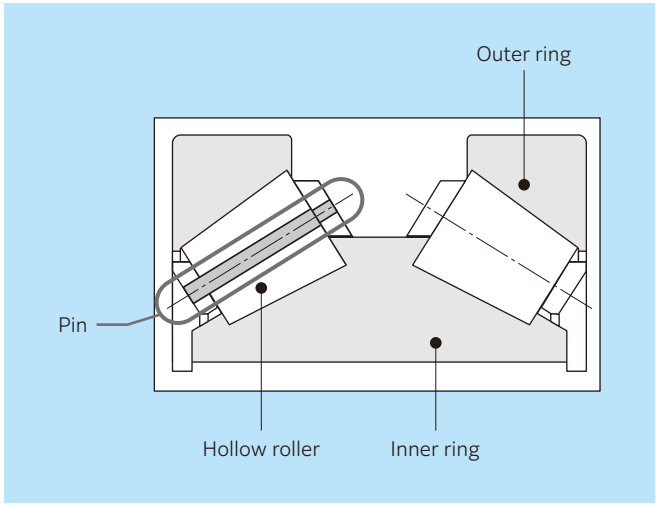

Fig. 2 Pin-type cage

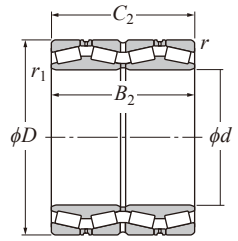
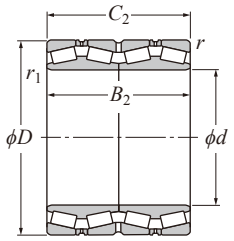
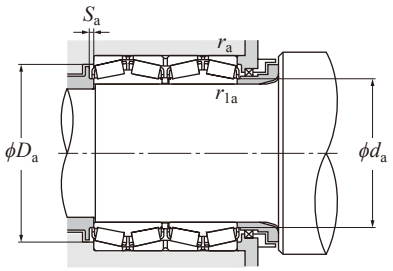


(TYPE A) with inner ring spacer



(TYPE B) without inner ring spacer

Four-Row Tapered Roller Bearings NTN



Dynamic equivalent radial load

$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \le e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y_1	0.67	Y_2

Static equivalent radial load

$P_{0r} = F_r + Y_0F_a$

For values of e, Y_1, Y_2 and Y_0 see the table below.

1) Smallest allowable dimension for chamfer dimension r or r_1.
2) Bearing numbers marked "◎" designate inch series bearings. "**CRO**" series bearings are also inch sized.
3) When adopting bearings with bearing numbers marked with "*", please consult **NTN** Engineering.
4) Bearing numbers marked "☆" designate bearings with hollow rollers and pin-type cages.

Dynamic equivalent radial load

$P_r = XF_r + YF_a$

$\frac{F_a}{F_r} \le e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y_1	0.67	Y_2

Static equivalent radial load

$P_{0r} = F_r + Y_0F_a$

For values of e, Y_1, Y_2 and Y_0 see the table below.

· Bearings are designed with oil seals on both sides of the bearing, which is the same as the four-row tapered roller bearings.
· Please consult with **NTN** Engineering for fitting and bearing internal clearance.

Fixed side SL-type cylindrical roller bearing (open type)

Floating side SL-type cylindrical roller bearing (open type)

SL-type cylindrical roller bearing for sheaves (sealed type)

1. Types, design features, and characteristics

SL-type cylindrical roller bearings are double row full complement cylindrical roller bearings that have a thin cross-section and can withstand extremely large radial loads and impact loads. These bearings are suitable for a wide range of slow-moderate speed, heavily loaded applications such as construction machinery, vehicles, steel machinery, and lifting machinery.

These bearings can be produced both with and without seals. **Table 1** shows the characteristics of this bearing type.

Table 1 SL-type cylindrical roller bearing types and characteristics

Type		Characteristics
Open type	 SL01 type  SL02 type	• The SL01 type is used for fixed side bearings and the SL02 is used for float side bearings. • The outer ring is divided in the circumferential direction by a special method and reconnected after rollers are embedded. **The bearing side surface needs to be firmly fixed in the axial direction by the shoulders of shafts and housings**. • The outer ring has oil grooves and oil holes. • The SL01 type can receive an axial load in both directions. • Dimensions D_a and d_a are applied for the shoulder dimension of shafts and housings. However, when a moment load or a large axial load is to be used, dimensions J and K are recommended.
Sealed type	 SL04 type	• The SL04 type is only designed as the fixed side bearing. • The inner ring is divided in the circumferential direction by a special method and reconnected after rollers are embedded. **The bearing side surface needs to be firmly fixed in the axial direction by the shoulders of shafts and housings.** • The inner ring has oil grooves and oil holes. • A radial load and an axial load in both directions can be applied to the bearing. • The bearings are shielded, filled with grease, and have snap rings in the outer ring. These bearings allow easy design into the application. The bearings are mainly used for sheaves. • Surface coating treatment is applied to prevent rust.

Note: For SL-type cylindrical roller bearings, three-row, four-row, and five-row bearings are also available besides the double-row. Please contact **NTN** Engineering.

2. Dimensional and rotational accuracy

SL-type cylindrical roller bearings are made according to JIS Class 0 [refer to **Table 3.3** (pages A-18 and A-19) in section "3. Bearing tolerances"]. The outer ring accuracy of the SL01 type and the SL02 type is before division. Regarding the SL04 type, the inner ring accuracy is before surface treatment and division, and the outer ring accuracy is before surface treatment.

3. Radial internal clearance

Table 2 shows the radial internal clearance values. It should be noted that the values differ from standard cylindrical roller bearings.

Table 2 Radial internal clearance Unit: μm

Nominal bore diameter d mm		CN (normal)		C3		C4	
Over	Incl.	Min.	Max.	Min.	Max.	Min.	Max.
80	120	35	105	80	150	105	175
120	180	60	150	110	200	150	240
180	250	90	190	155	255	205	305
250	315	110	225	195	310	255	370
315	400	140	265	245	370	320	445
400	500	180	320	300	440	395	535

4. Selection of recommended fits and radial internal clearance

Table 3 lists the recommended fit for outer ring rotation such as sheaves and wheels, **Table 4** lists the relation between the fitting and the radial internal clearance.

It is necessary to equally apply load on the entire surface of the raceway end on the bearing side face at the time of assembly and removal.

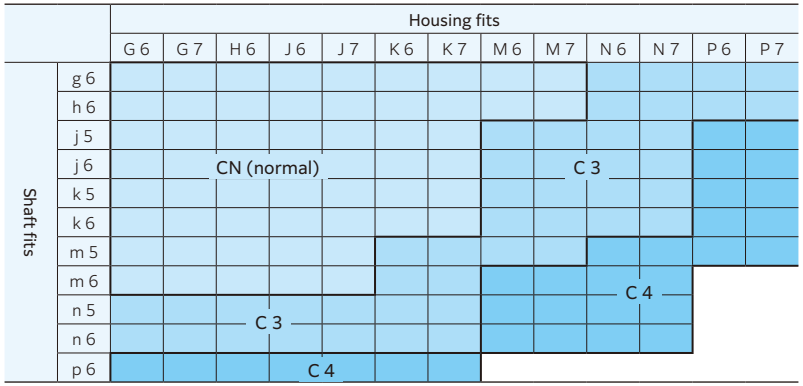
Table 3 Recommended fits

Conditions		Shaft tolerance class	Housing tolerance class
Outer ring Outer ring rotational load	Heavy load with thin wall housing	g6 or h6	P7
	Ordinary or heavy load		N7 [1]
	Light or fluctuating load		M7

1) N7 must be used for sheaves (to prevent snap ring from coming off).

Refer to **Table 4.2** (page A-33) in section "4. Bearing fits" for the inner ring rotational load.

Table 4 Relationship between fits and radial internal clearance



Note: Use CN (normal) clearance when the shaft fit is g6, the housing fit is N7 (N6), and the speed is low (for sheaves, etc.).

1) Smallest allowable dimension for chamfer dimension *r*.
2) Tolerance of dimension *Cf*1 SL04-5020NR to SL04-5034NR: −0.1 to −0.5 mm
SL04-5036NR to SL04-5088NR: −0.1 to −0.7 mm

Note: 1. The bearings have grease filled in. 2. Surface treatment is applied to bearings to prevent rust.
3. The bearings are non-contact shielded-type bearings, but contact sealed-type bearings are also available based on your request.

Lubrication type

- These are self-aligning sliding bearings: the sliding parts form a spherical surface. The bearings also can support radial loads and axial loads in either direction.
- A lubricant (oil or grease) should be used since the sliding parts are steel on steel.
- These bearings are suitable for swinging and aligning movements, and used in joint-movement parts for industrial and construction machines.

Note: 1. Dimension series **22**, **23**, and **24** are double row bearing series. For double row bearings, d_2 becomes the nominal bearing bore diameter.
2. For the outside diameter of the shaft raceway washer and the bore diameter of the housing raceway washer, see the dimension table of thrust bearings.

[How to read the table] If for example you want to convert 10 kgf to N, find "10" in the middle column of the first set of columns on the right. Look in the N column directly to the right of "10," and you will see that 10 kgf equals 98.066 N. Also, to convert 10 N to kgf, look in the kgf column to the right of "10" and you will see that 10 N equals 1.0197 kgf.

1 kgf = 9.80665 N
1 N = 0.101972 kgf

[How to read the table] If for example you want to convert 10 kg to lb, find "10" in the middle column of the first set of columns on the right. Look in the lb column directly to the right of "10," and you will see that 10 kg equals 22.046 lb. Also, to convert 10 lb to kg, look in the kg column to the left of "10" and you will see that 10 lb equals 4.536 kg.

1 kg = 2.2046226 lb
1 lb = 0.45359237 kg

[How to read the table] If for example you want to convert 10 °C to °F, find "10" in the middle column of the first set of columns. Look in the °F column directly to the right of "10", and you will see that 10 °C equals 50.0 °F. Also, to convert 10 °F to °C, look in the °C column to the left of "10" and you will see that 10 °F equals -12.2 °C.

[Conversion formula]

$℃ = \frac{5}{9}(℉ - 32)$

$℉ = 32 + \frac{9}{5}℃$

Appendix table -16: Greek alphabet list

Roman type (upright)	Italic type (slanted)		Name
